4-BIT MAGNITUDE COMPARATOR

CONNECTION DIAGRAM PINOUT A

DESCRIPTION — The '85 is a high speed, expandable 4-bit magnitude comparator which compares two 4-bit words in any monotonic code (binary, BCD or other) and generates three outputs: A less than B, A greater than B, and A equal to B. Three expansion inputs allow serial (ripple) expansion over any word length without external gates.

- EASILY EXPANDABLE
- BINARY OR BCD COMPARISON
- $A > B$, $A < B$, $A = B$ OUTPUTS AVAILABLE

ORDERING CODE: See Section 9

FUNCTIONAL DESCRIPTION—The '85 compares two 4-bit words (A, B). Each word has four parallel inputs (A_0 — A_3 , B_0 — B_3) of which A_3 and B_3 are the most significant. Three expander inputs ($I_A > B$, $I_A < B$, $I_A = B$) allow cascading without external gates. The three outputs ($O_A > B$, $O_A < B$, $O_A = B$) have only two gate delays from the expander inputs, thus reducing the delay time when units are cascaded for long words. The $I_A = B$ input to the least significant position must be held HIGH for proper compare operation. For serial (ripple) expansion, the $A > B$, $A < B$ and $A = B$ outputs are connected respectively to the $I_A > B$, $I_A < B$, and $I_A = B$ inputs of the next most significant comparator.

APPLICATIONS — Figure a shows a high speed method of comparing two 24-bit words with only two levels of device delay. With the technique shown in Figure b six levels of device delay result when comparing two 24-bit words. The parallel technique can be expanded to any number of bits, see Table I.

TABLE I

WORD LENGTH	NUMBER OF PKGS.
1-4 Bits	1
5-24 Bits	2-6
25-120 Bits	8-31

NOTE:
 The 54LS/74LS85 can be used as a 5-bit comparator only when the outputs are used to drive the A₀ — A₃ and B₀ — B₃ inputs of another 54LS/74LS85 as shown in Figure 2 in positions #1, 2, 3, and 4.
