

# 2-input, 1-output video signal switcher

## BA7654F

The BA7654F is video signal switch consisting of two input pins (IN1 and IN2), one CTL pin (CTL), and one output pin (OUT). The inputs are sync-tip clamped (synchronous edge of the video input signals are aligned to the same voltage), and as the input impedance is extremely large, it is possible to use a small value for the clamp capacitor (the recommended capacitor is 0.01 $\mu$ F (FZ) ceramic).

### ●Applications

VCRs, TVs, and other equipment using video signals

### ●Features

- 1) Small clamp capacitors can be used (ceramic, 3000pF (Min.), 0.01 $\mu$ F (FZ) (recommended)).
- 2) Low supply voltage operation possible supply voltage range is 3.7V to 7.7V.
- 3) Superimposition used for fast switching speed with low switching noise (70ns Typ.).
- 4) Low power consumption (when  $V_{CC} = 5V$ , 25mW Typ.).
- 5) Wide dynamic range (when  $V_{CC} = 5V$ , 3.1V<sub>P-P</sub> Typ.).
- 6) Excellent frequency characteristics (10MHz, 0dB Typ.).
- 7) Low interchannel crosstalk (–70dB Typ.).
- 8) Voltage can be applied to the control pins even when  $V_{CC}$  is not applied.

### ●Selected output mode setting table

CTL	OUT
L	IN1
H	IN2

### ●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Applied voltage	$V_{CC}$	9	V
Power dissipation	$P_d$	500*	mW
Operating temperature	$T_{opr}$	–25 ~ +75	°C
Storage temperature	$T_{stg}$	–55 ~ +125	°C

\* Reduced by 50mW for each increase in Ta of 1°C over 25 °C.

### ●Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Operating power supply voltage	$V_{CC}$	4.0 ~ 7.0	V

○Not designed for radiation resistance.

\* CTL switching level is substituted by performing the above measurements.

\*1 Connect a distortion meter to the output. After adding a f = 1kHz sine wave input from the OSC, adjust the input level so that the output distortion is 1.0%. The output voltage at that time is the maximum output level V<sub>om</sub> [V<sub>P-P</sub>].

\*2 Apply to the input pin a V<sub>IN</sub> = 1.0V<sub>P-P</sub>, f = 1MHz sine wave input.  
Voltage gain G<sub>v</sub> = 20·log (V<sub>OUT</sub> / V<sub>IN</sub>)

\*3 Apply to the input pin V<sub>IN</sub> = 1.0V<sub>P-P</sub>, f = 1MHz and 10MHz sine wave inputs.  
Frequency characteristics G<sub>f</sub> = G<sub>v</sub> (f = 1MHz) – G<sub>v</sub> (f = 10MHz)

\*4 Apply to the input pin a V<sub>IN</sub> = 1.0V<sub>P-P</sub>, f = 4.43MHz sine wave input.  
Interchannel crosstalk C<sub>ta</sub> = 20log (V<sub>OUT</sub> / V<sub>IN</sub>)

●Operation notes

- (1) To ensure stable clamp operation, the output impedance of the previous stage connected to the inputs should be  $1k\Omega$  or lower.
- (2) If large input clamp capacitors are used, the time constant of the circuit will mean that some time will be required until stable operation after power is applied. The value for the input clamp capacitors is  $0.1\mu\text{F}$  max. ( $0.01\mu\text{F}$  (FZ) ceramic capacitor recommended).
- (3) If CTL pins are unstable when open. Set them to either H or L.
- (4) When using superimposition, the DC voltage directly applied to the inputs should be at least 1.7V.
