Pulse/tone dialer for telephone set
BU8307CS/BU8307CF

The BU8307CS and BU8307CF are large scale integrated circuits with a pulse dialer and tone dialer integrated on a single chip. These products are capable of dialing in either pulse or tone mode, and can redial up to 32 digits.

●Applications
Telephones and cordless telephones

●Features
1) The chip includes both a pulse and tone dialer, making it possible to dial in either pulse or tone mode.
2) A wide operating voltage range enables direct powering by line current. The voltage range guaranteed for both pulse and tone dialing is 2.5V to 5.5V.
3) A built-in memory enables redialing of up to 32 digits.
   Note: In tone mode, the memory itself uses one digit, so please be aware that a maximum of 31 digits can be redialed.

4) The chip conforms to the standards of Japan, America, Canada, England, Korea, Taiwan, and Australia.
5) The V_{DD} power supply voltage is independent of the DTMF output level.
6) There is little deviation in the frequency dividing for the DTMF output frequency. The maximum on the + side is +0.15%, and on the - side is -0.08%.

●Block diagram

Keypad functions

| Key	Description
⓪ to ⑨	These are numeric keys, and dial signals are sent when one of these keys is pressed.
✳, ⌗	In tone mode, when these keys are pressed, the corresponding DTMF signals are sent. In pulse mode, if the ⌗ is the first key to be pressed after going off-hook, the redial operation is executed. The ✳ key switches the unit from pulse mode to tone mode.
PA	When this key is pressed, a 3.6-second pause is generated. It also serves as a "break pause" key when redialing.
T	This is used to switch from pulse mode to tone mode. It also serves as a "break pause" key when redialing.
R	This is used in both redial and inhibit redial operations. When redialing, it also serves as a "break pause" key.
H	Pressing this key initiates on-hook operation.

	COL1	COL2	COL3

Note: The frequency variation of the resonator itself is not included.

ROHM

Key operations   ↑ : Off-hook
                      ↓ : On-hook

(1) Normal dialing

↑ D_1 to D_n

After going off-hook, the dial data from the key input is written to the redial memory, and the dial signals are sent based on the specified mode (pulse or tone). There is no upper limit on the number of digits that can be dialed. Key input can also be entered during dial output. To inhibit subsequent redialing, press the R key twice after the dial signals have been sent.

(2) Access pause

↑ D_1 P_A D_2 to D_n

Pressing the P_A key automatically initiates a 3.6-second pause. Pauses can be stacked by simply pressing the P_A key the required number of times, each time being one 3.6-second pause.

During a pause, dialing input is allowed, just as during dial signal transmission. When redialing, if a pause is being executed, it can be canceled by pressing the P_A, T, or R key during the pause. Multiple causes being executed in succession can also be canceled by pressing the P_A, T, or R key one time during the cumulative pause.

(3) Redial

↑ R

↑ # (MODEIN = H or Z)

Redial is only accepted if the redial key is pressed immediately after going off-hook. After going off-hook, pressing the R key in tone mode or the # key in pulse mode causes the last number dialed to be redialed. Key input is not accepted when a redial signal is being output. After the redial digits have been transmitted, any number of valid key inputs are accepted and transmitted. The redial memory holds up to 32 digits. Redial is inhibited if more than 32 digits are dialed in pulse mode, or more than 31 digits are dialed in tone mode. In pulse mode, the following can be written to the redial memory : 0 to 9, P_A and T. In tone mode, the following can be written to the redial memory : 0 to 9, ✕, #, and P_A.

Further redialing is inhibited following completion of the redial output by pressing the R key twice in succession.

Note: In tone mode, because one digit of memory is used to store the mode, the maximum number of valid digits available for redialing is 31.

(4) Mode switching (mixed mode dialing)

↑ D_1 to D_i T (or ✕) D_{i+1} to D_n (MODEIN = H or Z)

Switching from pulse mode to tone mode can be done only once when in an off-hook state. Setting the mode switching pin to the pulse mode (MODEIN = HIGH or Z) and pressing the T (or ✕) key writes the data required to switch to tone mode into memory.

In pulse mode, pressing the T (or ✕) key while the dial signal is being sent automatically inserts a 3.6-second pause after all digits up to that key have been transmitted, and all subsequent dial signals are transmitted as tones. In this case, the ✕ signal is sent out as a DTMF signal. Also, because the information required to switch to the tone mode is written to the memory, mixed dialing is possible when redialing. When doing this, the mode setting will match that at the time of key input, regardless of the position of the MODEIN pin.

(5) Hooking

↑ H

This initiates the hooking operation. After the operation has been completed, a hooking pause is inserted automatically. If a dial signal is being transmitted when the H key is pressed, the dial sequence is immediately interrupted, and the hooking operation is initiated. The hooking time can be selected as either 607ms or 84ms, depending on the setting of the LH / SH pin. Pressing the H key initiates the following sequence : off-hook → on-hook (hooking time) → off-hook pause (hooking pause time) → off-hook operation.

Internal state of the IC when the H key is pressed

①The input mode is reset, and the circuit goes to standby state in the pulse mode.

If the MODEIN pin is LOW, however, the state is recognized as tone mode.

②The line pointer is reset, enabling redialing.

③After the H key has been pressed, other subsequent key input is enabled. The hooking operation is not written to the memory. While the hooking operation is in progress, the only key input which is not accepted is the H key. All other key input is accepted.

●Pin descriptions

(1) $\overline{ROW1}$ to $\overline{ROW4}$ and $\overline{COL1}$ to $\overline{COL4}$

These are the keyboard input pins. They can be connected to a 3 × 4 (2 of 7) standard keypad, or a 4 × 4 keypad. Key input becomes valid by either shorting a single $\overline{ROW}$ input and a single $\overline{COL}$ input, or setting a single $\overline{ROW}$ and a $\overline{COL}$ input to LOW at the same time. If two keys are pressed at the same time, the key input is ignored. In tone mode, a single tone can be generated by pressing two or more keys in the same row or column of the $\overline{ROW1}$ to $\overline{ROW4}$ and $\overline{CL1}$ to $\overline{COL3}$ matrices. If the two keys are not in the same row or column, the key input will be ignored.

(2) HS

This is the hook switching input pin. When this pin is LOW, the state is perceived as off-hook, and when HIGH , as on-hook. The pin is set to the off-hook state during a dial signal transmission, and to the on-hook state during memory hold.

(3) 67%/60%

This switches the dial pulse break ratio. In LOW state, the ratio is 60%, and in HIGH state, 67%.

(4) MODEOUT

This is the output pin for the mode state. When the output mode is set to the pulse mode, this pin is Z level, and when the output mode is set to the tone mode, this pin is LOW. It goes to Z level when on-hook. The output is Nch open drain output.

(5) MODEIN

This is the input pin for the mode state. When LOW, the tone mode is effective, and when Z, the pulse mode at 10pps is effective, and when HIGH, the pulse mode at 20pps is effective.

If the $\boxed{T}$ key is input, however, the mode switches to the tone mode, even if this pin is HIGH or Z state.

If this pin is set to HIGH or LOW level by applying resistance, the resistance level should be 10kΩ or less.

(6) OSCIN and OSCOUT

These are the input and output pins for the internal oscillator. A crystal resonator or ceramic resonator (CSA3.58MGU300AB or CST3.58MGWU300AB) is connected between OSCIN and OSCOUT. If CSA3.58 MGU300AB is connected, a CH-type 30 pF capacitor should be connected between each of these pins and V_{ss}.

(7) KEYTONE

This is the pin which outputs keytones. It has a CMOS output. When off-hook, this pin outputs a key-press confirmation tone for all valid key input in pulse mode, and for valid input of the $\boxed{P_A}$, $\boxed{R}$, and $\boxed{H}$ keys in tone mode.

The output frequency f_{KT} is 1193Hz and the output time t_{KT} is 34ms. When there is no output, this pin is LOW.

(8) LH/SH

This pin switches the hooking time. When LOW, the hooking time is 84ms, and when HGH, 607 ms.

(9)DTMF

In tone mode, this pin outputs the corresponding DTMF signal when a key is pressed. It is LOW level except when a DTMF signal is being sent. This has CMOS output. A 20kΩ resistor should be connected between this pin and V_{ss}.

(10) $\overline{MFMUTE}$

This goes LOW when a DTMF signal is sent. When there is no output, and when on-hook, it goes to Z level. This is Nch open drain output.

(11) $\overline{DPMUTE}$

When a dial pulse is being sent, and when an on-hook sequence is in progress, this goes LOW. In tone mode, when there is no output, and in on-hook state, this goes to Z level. The output is Nch open drain output.

(12) $\overline{DP}$

In pulse mode, this pin outputs the corresponding dial pulse when a key is pressed. It goes to Z level for a contact make and to LOW level for a contact break. It remains at Z level unless a dial pulse is being output. The output is Nch open drain output.

* If the rise of the power supply takes an extremely long time because of the method by which power is supplied, the CR time constant for the above circuit should be set to a sufficiently large value.

Pulse tone dialer

Telephones

●Operation notes

The reset circuits in the IC could fail to operate proper- ly, depending on the way the supply voltage rises when power is applied. To avoid problems, we recom- mend adding a circuit to the HS pin, as shown in the diagram below. (There is no need for this circuit, how- ever, if the HS pin momentarily goes HIGH by some other means, for example, by CPU control.)

●Application example
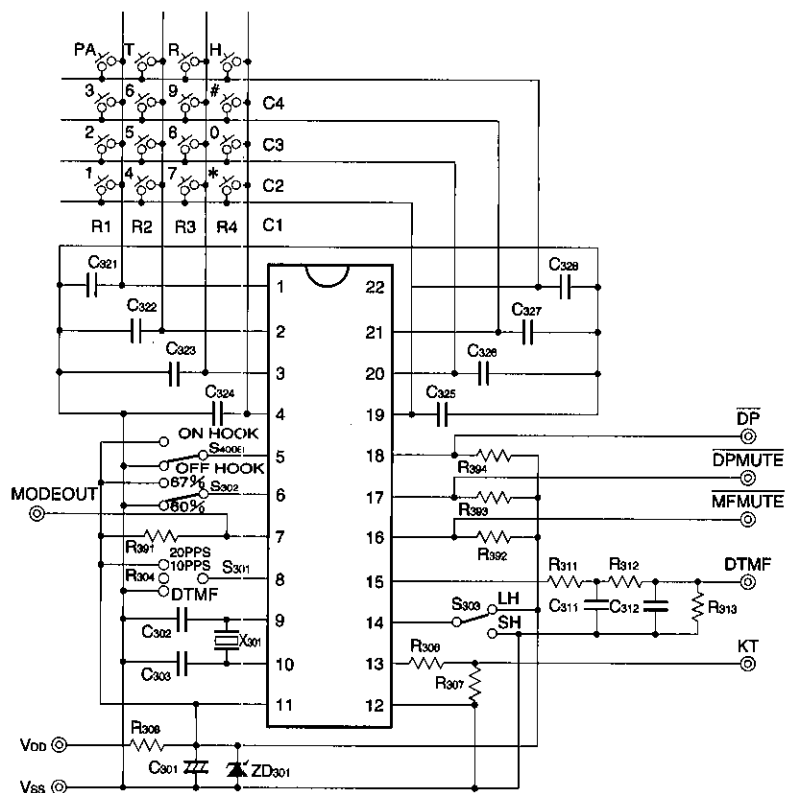

If noise or electromagnetic interference is a problem with the input pins ($\overline{ROW1}$ to $\overline{ROW4}$ and $\overline{COL1}$ to $\overline{COL4}$),connect a capacitor of about 470 pF (C_{321} to C_{328}) between each of the pins and the GND.

Fig. 17

ROHM

●Description of attachments

Part no.	Component	Model/Specification	Description
C301	Electrolytic capacitor	100 μF6.3V	Power supply bypass capacitor
C302	Ceramic capacitor	30pF	
C303	Ceramic capacitor	30pF	Resonator load capacitance (CH type)
C311	Film capacitor	15nF	Capacitance for configuration of DTMF output distortion correction low-pass filter
	Film capacitor	33nF	
C321~C328	Ceramic capacitor	470pF	Capacitance which prevents key input noise and electromagnetic interference from being mixed with signals
R304	Carbon resistor	10kΩ 1/8W	When a shorting-type switch is used with S301, there is a momentary short-circuit be tween VDD and GND when the switch slides. This is a resistor which prevents a drop in supply voltage when this occurs.
R306	Carbon resistor	100kΩ 1/8W	These two resistors form an attenuator to reduce the key tone output level.
R307	Carbon resistor	100kΩ 1/8W	
R308	Carbon resistor	510kΩ 1/8W	Current limiting resistor
R311	Carbon resistor	5.1kΩ 1/8W	Resistor for configuration of DTMF output distortion correction low-pass filter
R312	Carbon resistor	5.1kΩ 1/8W	
R313	Carbon resistor	5.1kΩ 1/8W	Resistor which divides DTMF output level
R391	Carbon resistor	10kΩ 1/8W	NMOS open drain output pull-up resistors. Pull-ups are required for waveform monitoring only; they are not required for actual use.
R392	Carbon resistor	10kΩ 1/8W	
R393	Carbon resistor	10kΩ 1/8W	
R394	Carbon resistor	10kΩ 1/8W	
ZD301	Zenner diodes	5.1V	Prevents the power supply voltage from exceeding the rated value (5.5 V max.).
X301	Resonator	Crystal or ceramic, 3.579545MHz	Dialer master oscillator. If using a ceramic resonator, use the CSA3.58MGU300AB.
S11~S44	Pushbutton switch	16pcs	Keypad switches; these should have a maximum contact resistance of 2 kΩ.
S400B	Toggle switch	2 contact points per line	Switch for providing hooking information to the dialer IC
S301	Toggle switch	2 contact points per line	Dial mode selector switch (20pps / 10pps / DTMF)
S302	Slide switch	3 contact points per line	Dial pulse break ration selector switch (67% / 60%)
S303	Toggle switch	2 contact points per line	Hooking time selector switch (LH / SH)

(Note) If shorting-type switches are used for any of the switches, always use a resistor on the VDD side of the switch to prevent the switch from shorting out the power supply, as is done with S302.

Notes

- The contents described in this catalogue are correct as of March 1997.
- No unauthorized transmission or reproduction of this book, either in whole or in part, is permitted.
- The contents of this book are subject to change without notice. Always verify before use that the contents are the latest specifications. If, by any chance, a defect should arise in the equipment as a result of use without verification of the specifications, ROHM CO., LTD., can bear no responsibility whatsoever.
- Application circuit diagrams and circuit constants contained in this data book are shown as examples of standard use and operation. When designing for mass production, please pay careful attention to peripheral conditions.
- Any and all data, including, but not limited to application circuit diagrams, information, and various data, described in this catalogue are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO., LTD., disclaims any warranty that any use of such device shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes absolutely no liability in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices; other than for the buyer's right to use such devices itself, resell or otherwise dispose of the same; no express or implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by ROHM CO., LTD., is granted to any such buyer.
- The products in this manual are manufactured with silicon as the main material.
- The products in this manual are not of radiation resistant design.

The products listed in this catalogue are designed to be used with ordinary electronic equipment or devices (such as audio-visual equipment, office-automation equipment, communications devices, electrical appliances, and electronic toys). Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers, or other safety devices) please be sure to consult with our sales representatives in advance.

- Notes when exporting
  - It is essential to obtain export permission when exporting any of the above products when it falls under the category of strategic material (or labor) as determined by foreign exchange or foreign trade control laws.
  - Please be sure to consult with our sales representatives to ascertain whether any product is classified as a strategic material.
