### **1** Introduction

#### 1.1 Description

The TAS3004 device is a system-on-a-chip that replaces conventional analog equalization to perform digital parametric equalization, dynamic range compression, and loudness contour. Additionally, this device provides high-quality, soft digital volume, bass, and treble control. All control parameters are uploaded through the I<sup>2</sup>C port from an outside MCU through the I<sup>2</sup>C slave port or from an external EPROM through the I<sup>2</sup>C master port.

The TAS3004 device also has an integrated 24-bit stereo codec with two I<sup>2</sup>C-selectable, single-ended inputs per channel.

The digital parametric equalization consists of seven cascaded, independent biquad filters per channel. Each biquad filter has five 24-bit coefficients that can be configured into many different filter functions (such as bandpass, high pass, and low pass).

The internal loudness contour algorithm can be controlled and programmed with an I<sup>2</sup>C command.

Dynamic range compression/expansion (DRCE) is programmable through the I<sup>2</sup>C port. The system designer can set the threshold, energy estimation time constant, compression ratio, and attack and decay time constants.

The TAS3004 device supports 13 serial interface formats ( $I^2S$ , left justified, right justified) with data word lengths of 16, 18, 20, or 24 bits. The sampling frequency ( $f_S$ ) may be set to 32 kHz, 44.1 kHz, or 48 kHz.

The TAS3004 device uses a system clock generated by the internal phase-locked loop (PLL). The reference clock for the PLL is provided by an external master clock (MCLK) of 256f<sub>S</sub> or 512f<sub>S</sub>, or a 256f<sub>S</sub> crystal.

The TAS3004 device has six internally configurable general-purpose input (GPI) terminals that control volume, bass, treble, and equalization. Each GPI terminal has a debounce algorithm that is programmed into the TAS3004 internal microcontroller.

#### 1.2 Features

- Programmable seven-band parametric equalization
- Programmable digital volume control
- Programmable digital bass and treble control
- Programmable dynamic range compression/expansion (DRCE)
- Programmable loudness contour/dynamic bass control
- Configurable serial port for audio data
- Two input data channels that can be mixed with digital data from the analog-to-digital converter (ADC) of the codec (analog input). These channels are controlled by I<sup>2</sup>C commands.
- Three output data channels: Left and right data go through equalization; bass, treble, DRCE, and volume to SDOUT1; SDOUT2 mixes left and right data. SDOUT2 operates as a center channel or subwoofer channel. The output of the ADC is available for additional processing.
- Capability to configure ADC output to one of two monaural data streams or one stereo data stream
- Capability to digitally mix left and right input channels for a monaural output to facilitate subwoofer operation
- Serial I<sup>2</sup>C master/slave port that allows:
  - Downloading of control data to the device externally from the EPROM or an I<sup>2</sup>C master

- Controlling other I<sup>2</sup>C devices
- Two I<sup>2</sup>C-selectable, single-ended analog input stereo channels
- Equalization bypass mode
- Single 3.3-V power supply
- Powerdown without reloading the coefficients
- Sampling rates: 32 kHz, 44.1 kHz, or 48 kHz
- Master clock frequency, 256f<sub>S</sub> or 512f<sub>S</sub>
- Can have crystal input to replace MCLK. Crystal input frequency is 256fs.
- Six GPI terminals for volume, bass, treble up/down control, mute, and selection of equalization filters

#### Table 1–1. TAS3004 Terminal Functions (Continued)

## 2 Audio Data Formats

#### 2.1 Serial Interface Formats

The TAS3004 device works in master or slave mode.

In the master mode, terminal 21 (IFM/S) is tied high. This activates the master clock (MCLK) circuitry. A crystal can be connected across terminals 13 (XTALI/MCLK) and 14 (XTALO), or an external, TTL-compatible MCLK can be connected to XTALI/MCLK. In that case, MCLK outputs from terminal 12 (MCLKO) with terminals 19 (LRCLK/O) and 20 (SCLK/O) becoming outputs to drive slave devices.

In the slave mode,  $\overline{IFM/S}$  is tied low. LRCLK/O and SCLK/O are inputs and the interface operates as a slave device requiring externally supplied MCLK, LRCLK (left/right clock), and SCLK (shift clock) inputs. There are two options for selecting the clock rates. If the 512f<sub>S</sub> MCLK rate is selected, terminal 11 (CLKSEL) is tied high and an MCLK rate of 512f<sub>S</sub> must be supplied. If the 256f<sub>S</sub> MCLK is selected, CLKSEL is tied low and an MCLK of 256f<sub>S</sub> must be supplied. In both cases, an LRCLK of 64SCLK must be supplied.

- MCLK and SCLK must be synchronous and their edges must be at least 3 ns apart.
- If the LRCLK phase changes more than 10MCLK, the codec automatically resets.

The TAS3004 device is compatible with 13 different serial interfaces. Available interface options are  $I^2S$ , right justified, and left justified. Table 2–1 indicates how the 13 options are selected using the  $I^2C$  bus and the main control register (MCR,  $I^2C$  address x01h). All serial interface options at either 16, 18, 20, or 24 bits operate with SCLK at 64f<sub>S</sub>. Additionally, the 16-bit mode operates at  $32f_S$ .

Figure 2–1 through Figure 2–9 illustrate the relationship between the SCLK, LRCLK, and the serial data I/O for the different interface protocols.

#### 2.2 ADC Digital Output Modes

ADC digital output mode (SDOUT0) has two operational modes, normal and monaural. In the normal mode, the output of the ADC conforms to the output modes described in Sections 2.2.1 through 2.2.3. To enter the normal output mode, bit 7 (ADM) in the analog control register must be cleared to 0. In the monaural output mode, the digital output of the ADC conforms to the output modes described in Sections 2.3.1 through 2.3.6. To enter the monaural mode, bit 7 (ADM) in the analog control register must be set to 1.

#### 2.2.1 MSB First, Right-Justified Serial Interface Format—Normal Mode

The normal output mode for the MSB first, right-justified serial interface format is for 16, 18, 20, and 24 bits with bit 7 (ADM) in the analog control register cleared to 0. Figure 2–1 shows the following characteristics of this protocol:

- Left channel is transmitted when LRCLK is high.
- The SDIN(s) (recorded) data is justified to the trailing edge of the LRCLK.
- The SDOUT(s) MSB (playback) data is transmitted at the same time as LRCLK edge and captured at the next rising edge of SCLK.
- If LRCLK phase changes by more than 10MCLK, the codec automatically resets.

Figure 2–1. MSB First, Right-Justified Serial Interface Format—Normal Mode

#### 2.2.2 I<sup>2</sup>S Serial Interface Format—Normal Mode

The normal output mode for the  $I^2S$  serial interface format is for 16, 18, 20, and 24 bits with bit 7 (ADM) in the analog control register cleared to 0.

Figure 2–2 shows the following characteristics of this protocol:

- Left channel is transmitted when LRCLK is low.
- SDIN is sampled with the rising edge of SCLK.
- SDOUT is transmitted on the falling edge of SCLK.
- If LRCLK phase changes by more than 10MCLK, the codec automatically resets.

Figure 2–2. I<sup>2</sup>S Serial Interface Format—Normal Mode

#### 2.2.3 MSB Left-Justified Serial Interface Format—Normal Mode

The normal output mode for the MSB left-justified serial interface format is for 16, 18, 20, and 24 bits with bit 7 (ADM) in the analog control register cleared to 0.

Figure 2–3 shows the following characteristics of this protocol:

- Left channel is transmitted when LRCLK is high.
- The SDIN data is justified to the leading edge of the LRCLK.
- The MSBs are transmitted at the same time as LRCLK edge and captured at the next rising edge of SCLK.

Figure 2–3. MSB Left-Justified Serial Interface Format—Normal Mode

#### 2.3 ADC Digital Output Mode—Monaural

For the monaural ADC digital output mode, bit 7 (ADM) is set to 1, and bit 6 (LRB) and bit 1 (INP) in the analog control register (see Section 4.8, *Analog Control Register Operation*) control the operation of the monaural output mode. All interface formats are for 16, 18, 20, and 24 bits.

# 2.3.1 MSB First, Right-Justified Serial Interface Format—Monaural ADC Mode, B Left Input Selected

The monaural output mode for the MSB first, right-justified serial interface format is for 16, 18, 20, and 24 bits with the following bits in the analog control register set as shown:

- Bit 7 (ADM) is set to 1.
- Bit 6 (LRB) is cleared to 0.
- Bit 1 (INP) is set to 1.

Figure 2–4 shows the following characteristics of this protocol:

- Left channel is transmitted when LRCLK is either high or low.
- The SDIN(s) (recorded) data is justified to the trailing edge of the LRCLK.
- The SDOUT(s) MSB (playback) data is transmitted at the same time as LRCLK edge and captured at the next rising edge of SCLK.
- If LRCLK phase changes by more than 10MCLK, the codec automatically resets.

Figure 2–4. MSB First, Right-Justified Serial Interface Format—Monaural ADC Mode, B Left Input Selected

#### 2.3.2 I<sup>2</sup>S Serial Interface Format—Monaural ADC Mode, B Left Input Selected

The monaural output mode for the I<sup>2</sup>S serial interface format is for 16, 18, 20, and 24 bits with the following bits in the analog control register set as shown:

- Bit 7 (ADM) is set to 1.
- Bit 6 (LRB) is cleared to 0.
- Bit 1 (INP) is set to 1.

Figure 2–5 shows the following characteristics of this protocol:

- Left channel is transmitted when LRCLK is either high or low.
- SDIN is sampled with the rising edge of SCLK.
- SDOUT is transmitted on the falling edge of SCLK.
- If LRCLK phase changes by more than 10MCLK, the codec automatically resets.

Figure 2–5. I<sup>2</sup>S Serial Interface Format—Monaural ADC Mode, B Left Input Selected

#### 2.3.3 MSB Left-Justified Serial Interface Format—Monaural ADC Mode, B Left Input Selected

The monaural output mode for the MSB left-justified serial interface format is for 16, 18, 20, and 24 bits with the following bits in the analog control register set as shown:

- Bit 7 (ADM) is set to 1.
- Bit 6 (LRB) is cleared to 0.
- Bit 1 (INP) is set to 1.

Figure 2–6 shows the following characteristics of this protocol:

- Left channel is transmitted when LRCLK is either high or low.
- The SDIN data is justified to the leading edge of the LRCLK.
- The MSBs are transmitted at the same time as LRCLK edge and captured at the next rising edge of SCLK.

Figure 2–6. MSB Left-Justified Serial Interface Format—Monaural ADC Mode, B Left Input Selected

# 2.3.4 MSB First, Right-Justified Serial Interface Format—Monaural ADC Mode, B Right Input Selected

The monaural output mode for the MSB first, right-justified serial interface format is for 16, 18, 20, and 24 bits with the following bits in the analog control register set as shown:

- Bit 7 (ADM) is set to 1.
- Bit 6 (LRB) is set to 1.
- Bit 1 (INP) is set to 1.

Figure 2–7 shows the following characteristics of this protocol:

- Right channel is transmitted when LRCLK is either high or low.
- The SDIN(s) (recorded) data is justified to the trailing edge of the LRCLK.
- The SDOUT(s) MSB (playback) data is transmitted at the same time as LRCLK edge and captured at the next rising edge of SCLK.
- If LRCLK phase changes by more than 10MCLK, the codec automatically resets.

Figure 2–7. MSB First, Right-Justified Serial Interface Format—Monaural ADC Mode, B Right Input Selected

#### 2.3.5 I<sup>2</sup>S Serial Interface Format—Monaural ADC Mode, B Right Input Selected

The monaural output mode for the  $I^2S$  serial interface format is for 16, 18, 20, and 24 bits with the following bits in the analog control register set as shown:

- Bit 7 (ADM) is set to 1.
- Bit 6 (LRB) is set to 1.
- Bit 1 (INP) is set to 1.

Figure 2–8 shows the following characteristics of this protocol:

- Right channel is transmitted when LRCLK is either high or low.
- SDIN is sampled with the rising edge of SCLK.
- SDOUT is transmitted on the falling edge of SCLK.
- If LRCLK phase changes by more than 10MCLK, the codec automatically resets.

Figure 2–8. I<sup>2</sup>S Serial Interface Format—Monaural ADC Mode, B Right Input Selected

#### 2.3.6 MSB Left-Justified Serial Interface Format—Monaural ADC Mode, B Right Input Selected

The monaural output mode for the MSB left-justified serial interface format is for 16, 18, 20, and 24 bits with the following bits in the analog control register set as shown:

- Bit 7 (ADM) is set to 1.
- Bit 6 (LRB) is set to 1.
- Bit 1 (INP) is set to 1.

Figure 2–9 shows the following characteristics of this protocol:

- Right channel is transmitted when LRCLK is either high or low.
- The SDIN data is justified to the leading edge of the LRCLK.
- The MSBs are transmitted at the same time as LRCLK edge and captured at the next rising edge of SCLK.

Figure 2–9. MSB Left-Justified Serial Interface Format—Monaural ADC Mode, B Right Input Selected

#### 2.4 Switching Characteristics

|                        | PARAMETER                                  | MIN | TYP                         | MAX   | UNIT |

NOTE 1: Maximum of 50-pF external load on SDOUT.

Figure 2–10. For Right-/Left-Justified, I<sup>2</sup>S, and Left-/Left-Justified Serial Protocols

### 3 Analog Input/Output

The TAS3004 device contains a stereo 24-bit ADC with two single-ended inputs per channel. Selection of the A or B analog input is accomplished by setting a bit in the analog control register (ACR) by an I<sup>2</sup>C command. Additionally, the TAS3004 device has a stereo 24-bit digital-to-analog converter (DAC).

#### 3.1 Analog Input

Figure 3–1 shows the technique and components required for analog input to the TAS3004 device. The maximum input signal must not exceed 0.7  $V_{rms}$ . Selection of the above component values gives a frequency response from 20 Hz to 20 kHz at a sampling frequency of 48 kHz without alias frequency problems.

Figure 3–1. Analog Input to the TAS3004 Device

#### 3.2 Analog Output

#### 3.2.1 Analog Output

The full scale analog output from the TAS3004 device is 0.7  $V_{rms}$ . It is referenced to VCOM which is approximately 1.5 Vdc. VCOM must be decoupled with the network as shown in Figure 3–2.

Figure 3–2. VCOM Decoupling Network

#### 3.2.2 Analog Output With Gain

Since the analog output from the TAS3004 device is 0.7  $V_{rms}$ , the output level can be increased by using an external amplifier. The circuit shown in Figure 3–3 boosts the output level to 1  $V_{rms}$  (when it has a gain of 1.414) and provides improved signal-to-noise ratio (SNR). Since this circuit lowers the noise floor, THD + N is improved also.

Figure 3–3. Analog Output With External Amplifier

#### 3.2.3 Reference Voltage Filter

Figure 3–4 shows the TAS3004 reference voltage filter.

Figure 3–4. TAS3004 Reference Voltage Filter

### 4 Audio Control/Enhancement Functions

#### 4.1 Soft Volume Update

The TAS3004 device implements a TI proprietary soft volume update. This feature allows a smooth and pleasant-sounding change from one volume level to another over the entire range of volume control (18 dB to mute).

The volume is adjustable by downloading a 4.16 gain coefficient through the  $I^2C$  interface. Table A–5 lists the 4.16 coefficients converted into dB for the range of –70 dB to 18 dB with 0.5-dB step resolution.

Right and left channel volumes can be unganged and set to different values. This feature implements a balance control.

Volume is changed by writing the desired value into the volume control registers. This is done by asserting the GPI terminals for volume-up or volume-down for a limited range of volume control. Alternately, volume control settings can be sent to the TAS3004 device over the I<sup>2</sup>C bus.

#### 4.2 Software Soft Mute

Mute is implemented by loading all zeros in the volume control register. This causes the volume to ramp down over a duration of 2048f<sub>S</sub> samples to a final output of 0 (– infinity dB).

Soft mute can be enabled by either asserting the mute GPI terminal or sending a mute command over the I<sup>2</sup>C bus.

#### 4.3 Input Mixer Control

The TAS3004 device is capable of mixing and multiplexing three channels of serial audio data. The mixing is controlled through three mixer control registers. This is accomplished by loading values into the corresponding bytes of the mixer left gain (07h) and mixer right gain (08h) control registers.

The values loaded into these registers are in 4.20 format—4 bits for the integer and 20 bits for the fractional part. Table A–8 lists the 4.20 numbers converted into dB for the range of -70 dB to 18 dB, although any positive 4.20 number may be used.

To mute any of the channels, 0s are loaded into the respective mixer control register.

Mixer controls are updated instantly and can cause audible artifacts for large changes in setting when updated dynamically outside of the fast load mode; therefore, it is desirable to use fast load in conjunction with the soft-volume mode.

SDIN1, SDIN2, and the ADC output can be mixed with a user-selectable gain for each channel. The gain control registers are represented in 4.20 format.

Figure 4–1. TAS3004 Mix Function

#### 4.4 Mono Mixer Control

The TAS3004 device contains a second mixer that performs the function of mixing left and right channel digital audio data from the input mixer in order to derive a monaural channel. This mixer has a fixed gain of –6 dB so that full scale inputs on L\_sum and R\_sum do not produce clipping on the resulting L+R\_sum.

The output of this mixer is present on terminal 24 (SDOUT2) and is generally used for a digitally-mixed subwoofer or center channel application.

#### 4.5 Treble Control

The treble gain level may be adjusted within the range of 15 dB to -15 dB with 0.5-dB step resolution. The level changes are accomplished by downloading treble codes (shown in Appendix A) into the treble gain register. Alternately, a limited range of treble control is available by asserting the GPI terminals.

The treble control has a corner frequency of 6 kHz at a 48-kHz sample rate.

The gain values for treble control can be found in Section A.3.

#### 4.6 Bass Control

The bass gain level can be adjusted within the range of 15 dB to -15 dB with 0.5-dB step resolution. The level changes are accomplished by downloading bass codes (shown in Appendix A) into the bass frequency control register. Alternately, a limited range of bass control is available by asserting the GPI terminals.

Bass control is a shelf filter with a corner frequency of 250 Hz at a 48-kHz sample rate.

The gain values for bass control can be found in Section A.4.

#### 4.7 De-Emphasis (DM)

De-emphasis is implemented in the DAC and is software controlled. De-emphasis is valid at 44.1 kHz and 48 kHz.

To enable de-emphasis, values are written into the analog control register via the I<sup>2</sup>C command. See Section 4.8 for analog control register operation.

Figure 4–2 illustrates the frequency response of the de-emphasis mode.

Frequency (kHz)

Figure 4–2. De-Emphasis Mode Frequency Response

#### 4.8 Analog Control Register Operation

The analog control register (ACR) allows control of de-emphasis, selection of the analog input channel to the ADC, and analog power down.

An I<sup>2</sup>C master is required to write the appropriate command into the ACR. The ACR subaddress is 0x40.

#### Table 4–1. Analog Control Register Description

#### 4.9 Dynamic Loudness Contour

The necessity for applying loudness compensation to playback systems to compensate for the fact that the ear perceives bass and treble less audibly at low levels than at high ones has been established with the first data published by Fletcher and Munson in 1933.

There are many equal-loudness contours in publication, like Steven's contours, Robinson and Dadson contours even reached the acceptance level of ISO recommendation.

The TAS3004 device has a simplified loudness contour algorithm that diminishes the effect of weak bass at low listening levels. Since contour has volume level dependency, the user must define the relation between the gain of the contour circuit and the volume level.

Figure 4–3 is a block diagram of this circuit.

Figure 4–3. Block Diagram

The loudness contour is activated by sending an activation command via I<sup>2</sup>C from an external device. Optionally, a contour gain command can be sent by an external device to provide tracking with the system's volume control.

#### 4.9.1 Loudness Biquads

Loudness biquad filters for the left and right channels are independently programmable via I<sup>2</sup>C. Their subaddresses are 0x21 and 0x22, respectively. The digital filters are written as five 24-bit (4.20) hex coefficients for each channel.

#### 4.9.2 Loudness Gain

Loudness gain values for the left and right channels are independently programmable via I<sup>2</sup>C. Their subaddresses are 0x23 and 0x24, respectively. The gain values are written as one 4.20 hex coefficient for each channel.

#### 4.9.3 Loudness Contour Operation

When the frequency of the loudness contour is determined, a digital filter must be developed. Then, the gain of the filter is determined. These values are placed in the storage area of the system controller (microcontroller) and sent to the TAS3004 device when it is desired to activate the loudness contour.

If it is necessary to change the frequency or gain of the contour, new gain and filter coefficients are sent by the system controller. This function is performed normally when the volume control is changed (that is, more volume, less contour). The gain of the loudness contour filter then tracks the volume control.

The loudness contour biquad filters are provided in addition to the seven equalization biquad filters.

See Section A.6 for programming instructions.

#### 4.10 Dynamic Range Compression/Expansion

The TAS3004 device provides the user with the ability to manage the dynamic range of the audio system. The DRCE receives data, and affects scaling after the volume/loudness block. As shown in Figure 4–4, the DRCE is applied after the volume/loudness control block as a DRCE scale factor. The DRCE must be adjusted such that the signal does not reach the hard limit value. However, if the signal does reach the maximum digital value, the saturation logic serves as a hard limiter that does not allow the signal to extend beyond the available range.

Figure 4–4. TAS3004 Digital Signal Processing Block Diagram

The DRCE instruction consists of eight bytes that must be sent each time in the order shown in the example code of Table A–9. Each instruction downloaded must be eight bytes. If only one byte is changed, all eight bytes must be transmitted. The first two bytes remain the same for every instruction, however the last six bytes can be programmed using hexadecimal values from the corresponding tables referred to in Section A.7.

With high compression ratios and fast attack times available, this function is suited for a commercial killer in a television set application.

#### 4.11 AllPass Function

This function is enabled by setting terminal 27 (ALLPASS) on the TAS3004 device to 1. When asserted, the internal equalization filters are set into AllPass (flat) mode. When this terminal is reset to 0, the equalization filters are returned to the equalization that was in use before the terminal was asserted.

In AllPass mode, the bass and treble controls are still functional.

This function is frequently used for headphones. When the headphone plug is inserted into its jack, a switched contact in the jack enables the AllPass function.

The AllPass function also can be activated by writing a 1 to bit 2 of the analog control register.

#### 4.12 Main Control Register 2 (43h)

The TAS3004 device contains two main control registers: main control register 1 (MCR1) and main control register 2 (MCR2). The MCR2 contains the bits associated with the AllPass function and the download of bass and treble control information, and it is accessed via  $I^2C$  with the address 43h.

MCR2 (43h)

| Bit     | b7  | b6 | b5 | b4 | b3 | b2 | b1  | b0 |
|---------|-----|----|----|----|----|----|-----|----|
| Туре    | R/W | R  | R  | R  | R  | R  | R/W | R  |
| Default | 0   | 0  | 0  | х  | х  | х  | 0   | 0  |

#### Table 4–2. Main Control Register 2 Description

| BIT   | TYPE | DESCRIPTION   |  |  |  |  |
|-------|------|---|--|--|--|--|
| b7    | R/W  | 0 = Normal operation (initial condition after reset)<br>1 = Download bass and treble                            |  |  |  |  |

| b1    | R/W  | 0 = Normal operation (initial condition after reset)<br>1 = AllPass mode (bass and treble are still functional) |  |  |  |  |
| b0    | R    | Reserved. Bit b0 returns 0 when read.   |  |  |  |  |

# 5 Filter Processor

### 5.1 Biquad Block

The biquad block consists of seven digital biquad filters per channel organized in a cascade structure, as shown in Figure 5–1. Each of these biquad filters has five downloadable 24-bit (4.20) coefficients. Each stereo channel has independent coefficients.

Figure 5–1. Biquad Cascade Configuration

#### 5.1.1 Filter Coefficients

The filter coefficients for the TAS3004 device are downloaded through the I<sup>2</sup>C port and loaded into the biquad memory space. Each biquad filter memory space has an independent address. Digital audio data coming into the device is processed by the biquad block and then converted into analog waveforms by the DAC. Alternately, filters can be loaded by asserting terminals on the GPI port.

#### 5.1.2 Biquad Structure

The biquad structure that is used for the parametric equalization filters is as follows:

$$H(z) = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2}}{a_0 + a_1 z^{-1} + a_2 z^{-2}}$$
(1)

**NOTE:**  $a_0$  is fixed at value 1 and is not downloadable.

The coefficients for these filters are represented in 4.20 format—4 bits for the integer part and 20 bits for the fractional part. In order to transmit them over  $l^2C$ , it is necessary to separate each coefficient into three bytes. The upper 4 bits of byte 2 is the integer part, and the second nibble of byte 2, byte 1, and byte 0 are the fractional parts.

The filters can be designed using the automatic loudspeaker equalization program (ALE) or a script running under MatLab named Filtermaker. Both of these tools are available from Texas Instruments.

# 6 I<sup>2</sup>C Serial Control Interface

#### 6.1 Introduction

Control parameters for the TAS3004 device can be loaded from an I<sup>2</sup>C serial EPROM by using the TAS3004 master interface mode. If no EPROM is found, the TAS3004 device becomes a slave device and loads from another I<sup>2</sup>C master interface. Information loaded into the TAS3004 registers is defined in Appendix A.

The I<sup>2</sup>C bus uses terminals 16 (SDA for data) and 15 (SCL for clock) to communicate between integrated circuits in a system. These devices can be addressed by sending a unique 7-bit slave address plus  $R/\overline{W}$  bit (1 byte). All compatible devices share the same terminals via a bidirectional bus using a wired-AND connection. An external pullup resistor must be used to set the high level on the bus. The TAS3004 device operates in standard mode up to 100 kbps with as many devices on the bus as desired up to the capacitance load limit of 400 pF.

Furthermore, the TAS3004 device supports a subset of the SMBus protocol. When it is attached to the SMBUS, then byte, word, and block transfers are supported. The SMBus NAK function is not supported and care must be taken with the sequence of the instructions sent to the TAS3004 device.

Additionally, the TAS3004 device operates in either master or slave mode; therefore, at least one device connected to the I<sup>2</sup>C bus must operate in master mode.

# 6.2 I<sup>2</sup>C Protocol

The bus standard uses transitions on SDA while the clock is high to indicate start and stop conditions. A high-to-low transition on SDA indicates a start and a low-to-high transition indicates a stop. Normal data bit transitions must occur within the low time of the clock period. Figure 6–1 shows these conditions. These start and stop conditions for the I<sup>2</sup>C bus are required by standard protocol to be generated by the master. The master must also generate the 7-bit slave address and the read/write (R/W) bit to open communication with another device and then wait for an acknowledge condition. The slave holds SDA low during acknowledge clock period to indicate an acknowledgment. When this occurs, the master transmits the next byte of the sequence.

After each 8-bit word, an acknowledgment must be transmitted by the receiving device. There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus. Figure 6–1 shows a generic data transfer sequence.

Figure 6–1. Typical I<sup>2</sup>C Data Transfer Sequence

Table 6–1 lists the definitions used by the  $I^{2}C$  protocol.

| DEFINITION      | DESCRIPTION  |
|-----------------|--|
| Transmitter     | The device that sends data   |
| Receiver        | The device that receives data  |
| Master          | The device that initiates a transfer, generates clock signals, and terminates the transfer           |
| Slave           | The device addressed by the master   |
| Multimaster     | More than one master can attempt to control the bus at the same time without corrupting the message. |
| Arbitration     | Procedure to ensure the message is not corrupted when two masters attempt to control the bus.        |
| Synchronization | Procedure to synchronize the clock signals of two or more devices                                    |

Table 6–1. I<sup>2</sup>C Protocol Definitions

#### 6.3 Operation

The 7-bit address for the TAS3004 device is 011010X R/ $\overline{W}$  where X is a programmable address bit, set by terminal 7 (CS1). Combining CS1 and the R/ $\overline{W}$  bit, the TAS3004 device can respond to four different I<sup>2</sup>C addresses (two read and two write). These two addresses are licensed I<sup>2</sup>C addresses that do not conflict with other licensed I<sup>2</sup>C audio devices. In addition to the 7-bit device address, subaddresses direct communication to the proper memory location within the device. A complete table of subaddresses and control registers is provided in Appendix A. For example, to change bass to 10-dB gain, Section 6.3.1 shows the data that is written to the I<sup>2</sup>C port:

| I <sup>2</sup> C ADDRESS BYTE | A6-A1  | CS1 (A0) | R/W |  |  |  |  |  |
|-------------------------------|--------|----------|-----|--|--|--|--|--|
| 0x68                          | 011010 | 0        | 0   |  |  |  |  |  |
| 0x69                          | 011010 | 0        | 1   |  |  |  |  |  |
| 0x6A                          | 011010 | 1        | 0   |  |  |  |  |  |
| 0x6B                          | 011010 | 1        | 1   |  |  |  |  |  |

 Table 6–2.
 I<sup>2</sup>C Address Byte Table

#### 6.3.1 Write Cycle Example

Start Slave Address R/W A Subaddress A Data A Stop

| FUNCTION      | DESCRIPTION  |
|---------------|--|
| Start         | Start condition as defined in I <sup>2</sup> C         |
| Slave address | 0110100 (CS1 = 0)                                      |
| R/W           | 0 (write)  |
| A             | Acknowledgement as defined in I <sup>2</sup> C (slave) |
| Subaddress    | 00000110 (see Appendix A)                              |
| Data          | 00011100 (see Appendix A)                              |
| Stop          | Stop condition as defined in I <sup>2</sup> C          |

NOTE: Table is for serial data (SDA); serial clock (SCL) is not shown but conditions apply as well.

Whenever writing to a subaddress, the correct number of data bytes must follow in order to complete the write cycle. For example, if the volume control register with subaddress 04 (hex) is written to, six bytes of data must follow; otherwise, the cycle is incomplete and errors occur.

#### 6.3.2 TAS3004 I<sup>2</sup>C Readback Example

The TAS3004 will save in a Stack or First-In First-Out (FIFO) buffer the last 7 bytes that were sent to it. When an  $I^2C$  read command is sent to the device (LSB=high), it answers by popping the first byte off the stack. The TAS3004 will then expect either a SendAck command or an  $I^2C$  Stop command from the host. If a SendAck command is sent from the host then the TAS3004 will pop another byte off the stack. If an  $I^2C$  Stop is sent then the TAS3004 will end this transaction. The proper sequence for reading is described as follows:

| I <sup>2</sup> C Start   |  |
|--|--|
| Send I2C address byte with read Bit Set to 1 (LSB set equal to 1)            |  |
| receive Byte 0   |  |
| Send Ack   |  |
| receive Byte 1   |  |
| Send Ack   |  |
| receive Byte 2   |  |
| Send Ack   |  |
| receive Byte 3   |  |
| Send Ack   |  |
| receive Byte 4   |  |
| Send Ack   |  |
| receive Byte 5   |  |
| Send Ack   |  |
| receive Byte 6 (if you send an ACK after Byte 6 it will lock up the TAS3004) |  |
| I <sup>2</sup> C Stop  |  |

Where:

- I<sup>2</sup>C Start is a valid I<sup>2</sup>C Start Command
- Receive Byte is a valid I<sup>2</sup>C Command which reads a byte from the TAS3004.
- SendAck is a avalid I<sup>2</sup>C Command that informs the TAS3004 that a byte has been read.
- I<sup>2</sup>C Stop is a valid I<sup>2</sup>C Stop Command
- NOTES: 1. The TAS3004 will appear to be locked up, if a SendACK is issued after the last byte read. It is required to send an I<sup>2</sup>C Stop Condition after the last byte and not a SendACK.
  - 2. The I<sup>2</sup>Cstart and I<sup>2</sup>Cstop commands are the same for both I<sup>2</sup>C read and I<sup>2</sup>C write.

#### 6.3.3 I<sup>2</sup>C Wait States

The TAS3004 device performs interpolation algorithms for its volume and tone controls. If a volume or tone change is sent to the part via I<sup>2</sup>C, the command sent after the volume or tone (bass and treble) change causes an I<sup>2</sup>C wait state to occur. This wait state lasts from 41 ms to 231 ms, depending on the system clock rate, the command sent, and, in the case of bass or treble, the amount of the change.

Secondly, if a long series of commands are sent to the TAS3004 device, it may occasionally create a short wait state on the order of 150  $\mu$ s to 300  $\mu$ s while it loads and processes the commands.

When a sample rate of 32 kHz is used, longer wait states can occur, occasionally up to 15 ms.

The preferred way to take care of wait states is to use an I<sup>2</sup>C controller that recognizes wait states. During the wait state period, it stops sending data over I<sup>2</sup>C. If this function is not available on the system controller, fixed delays can be implemented in the system software to ensure that the controller is not trying to send more data while the TAS3004 device is busy. Sending I<sup>2</sup>C data while the TAS3004 device is busy causes errors and locks up the device, which must then be reset.

Table 6–3 gives typical values of the wait states that can be expected with the various functions of the part:

|              | SYSTEM S | SAMPLING FR | EQUENCY |   |
|--------------|----------|-------------|---------|---|
|              | 32 kHz   | 44.1 kHz    | 48 kHz  | Comment   |
| Volume       | 62 ms    | 49 ms       | 41 ms   | Not dependent on size of change   |
| Bass         | 231 ms   | 167 ms      | 153 ms  | 0 to $-18 \text{ dB}, -1 \text{ dB} = 0.055 \text{ T} @ \text{ f}_{\text{S}}$ |
| Treble       | 231 ms   | 167 ms      | 153 ms  | 0 to $-18 \text{ dB}, -1 \text{ dB} = 0.055 \text{ T} @ \text{ f}_{\text{S}}$ |
| DRC On       | 300 µs   | 300 µs      | 300 µs  |   |
| Mixer        | None     | None        | None    |   |
| Loudness     | None     | None        | None    |   |
| Equalization | 15 ms    | 190 μs      | 300 µs  | Can occur with each filter  |

Table 6–3. I<sup>2</sup>C Wait States

#### 6.4 SMBus Operation

The TAS3004 device supports a subset of the SMBus protocol. With proper programming techniques, it is possible to use the SMBus to set up the TAS3004 device.

#### 6.4.1 Block Write Protocol

The TAS3004 device supports the block write protocol that allows up to 32 bytes to be sent as a block. To send a command using this format, the most significant bit (MSB) of the TAS3004 subaddress must be set high and the subaddress (also with MSB set high) must be programmed into the SMBus command byte. This operation signals the TAS3004 device to realize that the next byte is the SMBus byte count byte. The next byte after the byte count is then entered into the device as the first byte of data.

|                    | SMBus<br>Command Byte          |                            |      |      |      |
|--------------------|--------------------------------|----------------------------|------|------|------|
| 68h                | 8rh                            | XX                         | dd   | dd   | dd   |
| TAS3004<br>Address | Subaddress<br>(r = subaddress) | Byte Count<br>(Don't Care) | Data | Data | Data |

#### 6.4.2 Write Byte Protocol

The TAS3004 device also supports the SMBus write byte protocol. Writing to the main control register (MCR), bass, and treble registers require using the byte write protocol. To send a command using this format, the most significant bit (MSB) of the TAS3004 subaddress must be set high and the subaddress (also with MSB set high) must be programmed into the SMBus command byte. The next byte after the command byte is then entered into the device as the first byte of data.

|                    | SMBus<br>Command Byte          |      |
|--------------------|--------------------------------|------|
| 68h                | 8rh                            | dd   |
| TAS3004<br>Address | Subaddress<br>(r = subaddress) | Data |

#### 6.4.3 Wait States

If separate I<sup>2</sup>C/SMBus commands are sent too frequently, the TAS3004 device can generate a bus wait state. This happens when the device is busy while performing smoothing operations and changing volume, bass, and treble. The wait occurs after the bus acknowledge on the first data byte and can exceed the maximum allowable time allowed according to the SMBus specification (worst case 200 ms).

The following is a possible bus wait state scenario:

| CODE   | Start | 68 | 84 | 06 | 01 | 00                | 00 | 01 | 00 | 00 | Stop |      |
|--------|-------|----|----|----|----|-------------------|----|----|----|----|------|------|
| ACTUAL | Start | 68 | 84 | 06 | 01 | Wait <sup>†</sup> | 00 | 00 | 01 | 00 | 00   | Stop |

<sup>†</sup> If the master does not recognize bus waiting or if the master times out on a long wait, the master must not send consecutive I<sup>2</sup>C/SMBus commands without a time interval of 200 ms between transactions.

#### 6.4.4 TAS3004 SMBus Readback

The TAS3004 device supports a subset of SMBus readback. When an SMBus read command is sent to the device (LSB = high), it answers with the subaddress and the last six bytes written.

|          |       |               | SMBus<br>Command<br>Byte | Byte<br>Count |      |     |     |     |     |      |
|----------|-------|---------------|--------------------------|---------------|------|-----|-----|-----|-----|------|
| SENT     | Start | 69h           | xxh                      | 07h           | Stop |     |     |     |     |      |
| RECEIVED | Start | 07h           | aah                      | ddh           | ddh  | ddh | ddh | ddh | ddh | Stop |
|          |       | Byte<br>Count |                          |               |      |     |     |     |     |      |

Where:

- xxh = Command byte, it is a *don't care* because the response contains only the subaddress and the last six bytes of data written to the TAS3004 device
- aah = The last subaddress accessed in the device
- ddh = Data bytes from the TAS3004 device

NOTE: Use read sequence defined in 6.3.2

# 7 Microcontroller Operation

The TAS3004 device contains an internal microcontroller programmed by Texas Instruments to perform housekeeping and interface functions. Additionally, it handles I<sup>2</sup>C communication and general purpose input functions.

# 7.1 General Description

The microcontroller uses a 256f<sub>S</sub> system clock and can access up to 8K bytes of memory. It interfaces with the digital audio interface I<sup>2</sup>C master/slave for downloading data and coefficients. It also interfaces with two internal DSPs for transferring coefficients and other information.

The TAS3004 coefficients are loaded through  $I^2C$  in the master or slave mode. Standard audio processing functions (volume, bass, and treble) can be controlled/activated through external switches connected to the six GPI terminals. Upon reset, the internal microcontroller sets all coefficients and audio parameters to the default values. See Section 7.2.2 for default values.

If the TAS3004 address is 68h (ADDR\_SEL=0), it becomes the bus master device and attempts to load parameters and coefficients from the external EPROM. If no EPROM is present, the TAS3004 device remains in its default condition. If addresses other than 68h/69h are set, the TAS3004 device only operates as an I<sup>2</sup>C slave device.

If the microcontroller determines the TAS3004 device has an I<sup>2</sup>C address of 68h/69h and the EPROM is present, the microcontroller downloads coefficients from the EPROM. Once the download is complete, it enables the serial audio in the mode defined by an I<sup>2</sup>C write to the MCR to transfer data into and out of the device. Before reading the EPROM, the serial audio port defaults to I<sup>2</sup>S mode.

The TAS3004 device allows the user to update volume, bass, and treble dynamically by an I<sup>2</sup>C slave command or by a simple GPI switch input. The GPI can select volume up and down, bass/treble up and down, or digital equalizations. Up to five different equalizations (that is, flat, jazz, rock, voice, etc.) can be stored in the external EPROM. Also, DRCE, MCR1, MCR2, and loudness contour are enabled and disabled by I<sup>2</sup>C.

When the TAS3004 device operates in the I<sup>2</sup>C master mode, it echoes changes to all of its functions to other I<sup>2</sup>C addresses that are defined in its external EPROM. If no addresses are defined, it does not echo.

## 7.2 Power-Up/Power-Down Reset

#### 7.2.1 Power-Up Sequence

An active low on terminal 6 (RESET) while MCLK is running, resets the internal microcontroller and DSP(s). RESET synchronizes internally and can be asserted asynchronously or with the simple RC circuit in Figure 7–1. On reset, SCL and SDA go to a high-impedance state. If the I<sup>2</sup>C address is set to 68h, approximately 400  $\mu$ s after RESET returns to a 1, the device sends a one-byte query via I<sup>2</sup>C to look for an EPROM. If an EPROM is found, it becomes an I<sup>2</sup>C master; otherwise, it becomes an I<sup>2</sup>C slave. When using address 68h in the slave mode, an external master must wait until after the EPROM query or else bus contention and improper operation occurs.

I<sup>2</sup>C address x6Ah does not query the bus for an EPROM. The address for the EPROM is xA0h.

#### 7.2.2 Reset

The TAS3004 device has an asynchronous reset terminal (RESET). This reset is synchronized with various clocks used in this device to generate a synchronous internal reset. Upon reset, the TAS3004 device goes through the following process:

• Clears all the RAM memory content

- Clears all the registers in the circuits
- Purges the codec
- Selects analog input A (RINA and LINA) and sets the input A active indicator (INPA) low.
- Initializes the equalization parameters to AllPass filters
- Sets the digital audio interface to I<sup>2</sup>S—18-bit mode
- Sets the bass/treble to 0 dB
- Sets the mixer gain to 0 dB SDIN1 and mutes both SDIN2 and analog-in
- Sets the volume to -40 dB
- Turns off all enhancement features (DRCE, etc.).
- Reads the I<sup>2</sup>C address. If the address is 68h, the device reads its EPROM. It is possible to load the user-defined bass/treble data and break points (optional). If there is no data, the device loads default bass/treble delta and break points from ROM.
- If the address is 6Ah, the device puts the I<sup>2</sup>C interface in slave mode and waits for input.

#### 7.2.3 Reset Circuit

Since the TAS3004 device has an internal power-on reset (POR), in many cases, additional components are not needed to reset the device. It resets internally at approximately 80% of V<sub>DD</sub>.

In the case where the system's power supplies are slow in reaching their final voltage or where there is a difference in the time the system power supplies take to become stable, the TAS3004 reset can be delayed by a simple RC circuit.

Figure 7–1. TAS3004 Reset Circuit

The values for the above circuit can be calculated by the simple equation:

 $t_{rd} = 0.8RC + 400 \,\mu s$ 

Where:  $t_{rd}$  = The delay before the TAS3004 device comes out of reset

C = Value of the capacitance from  $\overline{\text{RESET}}$  (pin 6) to  $\text{DV}_{SS}$ 

R = Value of the resistance from  $\overline{\text{RESET}}$  (pin 6) to  $DV_{DD}$ 

The circuit described in Figure 7–1 delays the start-up of the TAS3004 device approximately 1.2 ms.

When it is necessary to control the reset of the TAS3004 device with an external device, such as a microcontroller,  $\overline{\text{RESET}}$  (pin 6) can be treated as a logic signal. It then brings the device out of reset when the voltage on  $\overline{\text{RESET}}$  reaches V<sub>DD</sub>/2.

#### 7.2.4 Fast Load Mode

While in fast load mode, it is possible to update the parametric equalization without any audio processing delay. The audio processor pauses while the RAM is updated in this mode. Bass and treble cannot download in this mode. Mixer1 and Mixer2 registers can download in this mode or normal mode (FL bit = 0).

Once the download is complete, the fast load bit must be cleared by writing a 0 into bit 7 of the main control register (MCR). This puts the TAS3004 device into normal mode.

#### 7.2.5 Codec Reset

During initialization, the output of the CODEC is disabled. Throughout reset and initialization, the output of the DAC is muted to prevent extraneous noise being sent to the system output.

Data from the ADC and other internal processing is purged so that when reset/initialization is complete, only valid inputs are sent to the system output.

### 7.3 Power-Down Mode

The TAS3004 device has an asynchronous power-down mode. In the power-down mode, the internal control registers and equalization programming of the device are stored in the device.

To enter power-down mode:

- Assert the power-down control signal (1)
- Set the serial audio input clocks to 0

The TAS3004 device goes into power-down mode.

To exit the power-down mode:

- Assert RESET (logic 0)
- Restart the serial audio clocks
- Wait for a delay of 1.0 ms (to allow the PLL to lock)
- Negate the power-down control signal (logic 0)
- Negate RESET (logic 1)

The device then returns to the state it was in before power down (resumes normal operation).

#### 7.3.1 Power-Down Timing Sequence

Figure 7–2. Power-Down Timing Sequence

In power-down mode, the TAS3004 device consumes typically less than 1 mA.

# 7.4 Test Mode

Terminal 9 (TEST) is tied low in normal operation. This function is reserved for factory test and must not be asserted.

#### 7.5 Internal Interface

Figure 7–3 shows the block diagram of the interface between the microcontroller and its peripheral blocks.

## 7.6 GPI Terminal Programming

During initialization, the microcontroller fetches a control byte from its EPROM or receives a command from I<sup>2</sup>C.

#### 7.6.1 Switch Interface

The six GPI terminals are programmed to operate in the following manner:

|                | GPI5 | GPI4 | GPI3 | GPI2 | GPI1 | GPI0 |  |  |
|----------------|------|------|------|------|------|------|--|--|
| VOL_UP, +1 dB  | x    |      |      |      |      |      |  |  |
| VOL_DN, -1 dB  |      | х    |      |      |      |      |  |  |
| BASS_UP, +1 dB |      |      | х    |      |      |      |  |  |
| BASS_DN, -1 dB |      |      |      | х    |      |      |  |  |
| TREB_UP, +1 dB |      |      |      |      | х    |      |  |  |
| TREB_DN, -1 dB |      |      |      |      |      | х    |  |  |
| Shift 1        | х    |      |      |      |      | х    |  |  |
| Mute           | х    |      |      |      |      |      |  |  |
| EQ1            |      | х    |      |      |      |      |  |  |
| EQ2            |      |      | х    |      |      |      |  |  |
| EQ3            |      |      |      | х    |      |      |  |  |
| EQ4            |      |      |      |      | х    |      |  |  |
| EQ5            |      |      |      |      |      | х    |  |  |
| Shift 2        |      |      | х    | х    |      |      |  |  |

 Table 7–1. GPI Terminal Programming

NOTE: x = Logic low

Initially (after reset), the TAS3004 GPI is set to control volume, bass, and treble. Simultaneously setting GPI bits 1 and 5 low for 1 second changes the function of the GPI terminals to control mute and equalization.

To return to volume, bass, and treble control, simultaneously set GPI terminals 2 and 3 low for 1 second.

When a GPI switch is activated, the TAS3004 device echoes its function over I<sup>2</sup>C to a TAS3001 device mapped to address x6Ah. Therefore, a system with two audio equalization chips can be implemented without the need for a microcontroller.

#### 7.6.2 GPI Architecture

The GPI provides simple but flexible input port to activate the input parameters. Each terminal input is an active logic low.

Figure 7–3. Internal Interface Block Diagram

# 7.7 External EPROM Memory Maps

Table 7–2 through Table 7–5 show the 512-byte and 2048-byte EPROM memory maps.

| ADDRESS   | BYTE NUMBER | FUNCTION                    |                        |  |  |  |
|-----------|-------------|-----------------------------|------------------------|--|--|--|
| 000h      | 1           | Signature (2Ah)             |                        |  |  |  |
| 001h      | 1           | ID byte = 0000 0000         |                        |  |  |  |
| 002h      | 1           | MCR                         |                        |  |  |  |
| 003h–00Bh | 9           | Mixer left gain             |                        |  |  |  |
| 00Ch014h  | 9           | Mixer right gain            |                        |  |  |  |
| 015h–01Ah | 6           | DRC (ratio, threshold, ener | rgyα, attackα, decayα) |  |  |  |
| 01Bh      | 1           | Bass                        |                        |  |  |  |
| 01Ch      | 1           | Treble                      |                        |  |  |  |
| 01Dh-022h | 6           | Volume                      |                        |  |  |  |
| 031h–03Fh | 15          | Biquad 0                    |                        |  |  |  |
| 040h–04Eh | 15          | Biquad 1                    |                        |  |  |  |
| 04Fh05Dh  | 15          | Biquad 2                    |                        |  |  |  |
| 05Eh-06Ch | 15          | Biquad 3                    | Left channel           |  |  |  |
| 06Dh-07Bh | 15          | Biquad 4                    |                        |  |  |  |
| 07Ch08Ah  | 15          | Biquad 5                    |                        |  |  |  |
| 08Bh099h  | 15          | Biquad 6                    |                        |  |  |  |
| 09Ah      | 1           | 0 dB/bass                   |                        |  |  |  |
| 09Bh      | 1           | 0 dB/treble                 |                        |  |  |  |
| 09Ch-0A1h | 6           | Bass break                  |                        |  |  |  |
| 0A2h-0A7h | 6           | Treble break                |                        |  |  |  |
| 0A8h–110h | 105         | Bass delta                  |                        |  |  |  |
| 111h–179h | 105         | Treble delta                |                        |  |  |  |
| 17Ah–17Fh | 6           | Bass set point              |                        |  |  |  |
| 180h–185h | 6           | Treble set point            |                        |  |  |  |
| 186h–194h | 15          | Biquad 0                    |                        |  |  |  |
| 195h–1A3h | 15          | Biquad 1                    |                        |  |  |  |
| 1A4h–1B2h | 15          | Biquad 2                    |                        |  |  |  |
| 1B3h-1C1h | 15          | Biquad 3 Right channel      |                        |  |  |  |

NOTE: Bytes are in the same order as they appear in the I<sup>2</sup>C register map. The EPROM address is xA0h.

# 8 Electrical Characteristics

## 8.1 Absolute Maximum Ratings Over Operating Temperature Ranges<sup>†</sup>

| Supply voltage range:     | AV <sub>DD PLL</sub>     | –0.3 V to 3.6 V                 |
|---------------------------|--------------------------|---------------------------------|
|                           | DV <sub>DD</sub>         | –0.3 V to 3.6 V                 |
| Digital input voltage rai | nge:                     | –0.3 to V <sub>DD</sub> + 0.3 V |
| Operating free-air temp   | perature, T <sub>A</sub> | 0°C to 70°C                     |
| Storage temperature ra    | ange, T <sub>stg</sub>   | –65°C to 150°C                  |
| Case temperature for 1    | IO seconds               | +122°C                          |
| Lead temperature from     | a case for 10 seconds    | +97.8°C                         |
| Electrostatic discharge   | (see Note 1)             |                                 |

<sup>†</sup> Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: Human body model per Method 3015.2 of MIL-STD-833B.

# 8.2 Recommended Operating Conditions

#### $T_{A}$ = 25°C, $AV_{DD}$ = 3.3 V, $DV_{DD}$ = 3.3 V

Voltages at analog inputs and outputs and at AV<sub>DD</sub> are with respect to ground.

|                                  |                         | MIN | NOM | MAX  | UNIT |
|----------------------------------|-------------------------|-----|-----|------|------|
| Supply voltage, AV <sub>DD</sub> |                         | 3.0 | 3.3 | 3.6  | V    |
| Supply voltage, DV <sub>DD</sub> |                         | 3.0 | 3.3 | 3.6  | V    |
| Supply current, analog           | Operating               |     | 34  |      | mA   |
|                                  | Power down (see Note 2) |     | 88  |      | μΑ   |
|                                  | Operating               |     | 47  |      | mA   |
| Supply current, digital          | Power down (see Note 2) |     | 942 |      | μΑ   |
|                                  | Operating               |     | 267 |      | mW   |
| Power dissipation                | Power down (see Note 2) |     |     | 0.35 | W    |

NOTE 2: If the clocks are turned off.

#### 8.3 Static Digital Specifications

| Gain error                           |                               |            |       | 5%  |      |  |  |
| Gain matching                        |                               |            | ±0.02 |     | dB   |  |  |

NOTE 3: Measured with a 50-mV peak sine curve.

#### 8.6 Input Multiplexer

 $T_A = 25^{\circ}C$ ,  $AV_{DD} = 3.3 \text{ V}$ ,  $DV_{DD} = 3.3 \text{ V}$ ,  $f_S = 48 \text{ kHz}$ , 20-bit I<sup>2</sup>S mode All terms characterized by frequency are scaled with the chosen sampling frequency,  $f_S$ .

| PARAMETER                      | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--------------------------------|-----------------|-----|-----|-----|------|
| Input impedance                |                 |     | 20  |     | kΩ   |
| Crosstalk                      |                 |     | 85  |     | dB   |
| Full scale input voltage range |                 |     | 1.7 |     | VPP  |

## 8.7 DAC Interpolation Filter

 $T_A$  = 25°C, AV\_{DD} = 3.3 V, DV\_{DD} = 3.3 V, f\_S = 48 kHz, 20-bit I<sup>2</sup>S mode

All terms characterized by frequency are scaled with the normal mode sampling frequency, f<sub>S</sub>. See Figure 8–5 and Figure 8–6 for performance curves of the DAC digital filter.

| PARAMETER             | TEST CONDITIONS   | MIN | TYP    | MAX  | UNIT |
|-----------------------|-------------------|-----|--------|------|------|
| Pass band             |                   | 0.0 |        | 20.0 | kHz  |
| Pass band ripple      |                   |     | ±0.005 |      | dB   |
| Stop band             |                   |     | 24.1   |      | kHz  |
| Stop band attenuation | 28.8 kHz to 3 MHz | 75  |        |      | dB   |
| Group delay           |                   |     | 700    |      | μs   |

Figure 8–6. DAC Digital Filter Passband Ripple Characteristics

# 8.8 Digital-to-Analog Converter

 $T_A = 25^{\circ}C$ ,  $AV_{DD} = 3.3 \text{ V}$ ,  $DV_{DD} = 3.3 \text{ V}$ ,  $f_S = 48 \text{ kHz}$ , input = 0 dB-f<sub>S</sub> sine wave at 1 kHz All terms characterized by frequency are scaled with the chosen sampling frequency,  $f_S$ .

| PARAMETER                                      | TEST CONDITIONS              | MIN  | TYP  | MAX  | UNIT   |
|--|------------------------------|------|------|------|--------|
| SNR (EIAJ)                                     | A weighted                   | 94   | 99   |      | dB     |
| Dynamic range                                  | –60 dB, 1 kHz                | 92   | 96   |      | dB     |
| Signal to (noise + distortion) ratio           | 0 dB, 1 kHz, 20 Hz to 20 kHz |      | 83   |      | dB     |
| Power supply rejection ratio                   | 1 kHz                        |      | 50   |      | dB     |
| Idle channel tone rejection                    |                              |      | +118 |      | dB     |
| Intermodulation distortion                     |                              |      | -75  |      | dB     |
| Frequency response                             |                              | -0.5 |      | +0.5 | dB     |
| Deviation from linear phase                    |                              |      |      | ±1.4 | degree |
| DAC crosstalk                                  |                              |      | -96  |      | dB     |
| Jitter tolerance                               |                              |      | 150  |      | ps     |
| Full scale, single-ended, output voltage range |                              |      | 1.9  |      | VPP    |
| DC offset                                      |                              | -7.0 |      | 7.0  | mV     |

# 8.9 DAC Output Performance Data

 $T_A$  = 25°C,  $AV_{DD}$  = 3.3 V,  $DV_{DD}$  = 3.3 V

The output load resistance is connected through a dc blocking capacitor.

| PARAMETER                               | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|-----------------|-----|-----|-----|------|
| Output load resistance                  |                 | 10  |     |     | kΩ   |
| Output load capacitance                 |                 |     |     | 25  | pF   |
| VCOM internal resistance (see Note 4)   |                 |     | 1   |     | kΩ   |
| VCOM output CLOAD                       |                 |     | 10  | 100 | μF   |
| VRFILT internal resistance (see Note 5) |                 |     | 1   |     | kΩ   |

NOTES: 4. VCOM may vary during power down.

5. VRFILT must never be used as a voltage reference.

# 8.10 I<sup>2</sup>C Serial Port Timing Characteristics

|                    |                                      | MIN | MAX  | UNIT |
|--------------------|--------------------------------------|-----|------|------|
| f <sub>scl</sub>   | SCL clock frequency                  | 0   | 100  | kHz  |
| t <sub>buf</sub>   | Bus free time between start and stop | 4.7 |      | μs   |
| tlow               | Low period of SCL clock              | 4.7 |      | μs   |
| thigh              | High period of SCL clock             | 4.0 |      | μs   |
| <sup>t</sup> hdsta | Hold time repeated start             | 4.0 |      | μs   |
| t <sub>susta</sub> | Setup time repeated start            | 4.7 | 20   | μs   |
| <sup>t</sup> hddat | Data hold time (See Note 6)          | 0   |      | μs   |
| <sup>t</sup> sudat | Data setup time                      | 250 |      | ns   |
| t <sub>r</sub>     | Rise time for SDA and SCL            |     | 1000 | ns   |
| t <sub>f</sub>     | Fall time for SDA and SCL            |     | 300  | ns   |
| t <sub>susto</sub> | Setup time for stop condition        | 4.0 |      | μs   |
| Cb                 | Capacitive load for each bus line    |     | 400  | pF   |

NOTE 6: A device must internally provide a hold time of at least 300 ns for the SDA signal to bridge the undefined region of the falling edge of SCL.

► tHD(STA)
NOTE: t<sub>IOW</sub> is measured from the end of t<sub>f</sub> to the beginning of t<sub>r</sub>. t<sub>high</sub> is measured from the end of t<sub>r</sub> to the beginning of t<sub>f</sub>.

# A.2 Volume Gain Command

| <br>The gain end is less than 0.12 db (exclusive mule). |            |           |          |         |           |          |         |  |  |  |
|---|------------|-----------|----------|---------|-----------|----------|---------|--|--|--|
| Device ID   | Subaddress | VL(23–16) | VL(15–8) | VL(7–0) | VR(23–16) | VR(15–8) | VR(7–0) |  |  |  |

The gain error is less than 0.12 dB (exclusive mute).

#### For example, if left volume = 6 dB and right volume = -6 dB, then the command is:

| 68 | 04 | 01 | FE | CA | 00 | 80 | 4E |
|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |

#### Table A–5. Volume Versus Gain Values

|           | VOLUME                          | 1         | VOLUME                          |           | VOLUME                          |           | VOLUME                          | 1         | VOLUME                          |
|-----------|---------------------------------|-----------|---------------------------------|-----------|---------------------------------|-----------|---------------------------------|-----------|---------------------------------|

Table A–5. Volume Versus Gain Values (Continued)

# A.3 Treble Control Register Command

Both left and right channel are given the same treble gain setting.

| Device ID | Subaddress | T(7–0) |
|-----------|------------|--------|
|-----------|------------|--------|

For example, if treble gain = 5 dB, then the command is:

| 68 05 65 |
|----------|
|----------|

# A.5 I<sup>2</sup>C Mixer Register Command

The gain error is less than 0.12 dB, excluding mute.

| Device ID Subaddress | Mixer1 | Mixer2 | ADC Mixer |
|----------------------|--------|--------|-----------|
|----------------------|--------|--------|-----------|

For example, if Sdin1 Mix = +6dB, Sdin2 Mix = 0dB, and ADC Mix = Mute, then the command is:

| Le | eft |    |          |          |          |
|----|-----|----|----------|----------|----------|
|    | 68  | 07 | 1F EC 98 | 10 00 00 | 00 00 00 |
| Ri | ght |    |          |          |          |
|    | 68  | 08 | 1F EC 98 | 10 00 00 | 00 00 00 |

Even if only one of the mixers needs to be changed, the whole command must be sent.

|                            |                       |                  |                          |        |          |          |  |  |

The gain error is less than 0.12 dB, excluding mute.

### A.7 Examples of DRCE

The gain error is less than 0.12 dB (excluding mute).

#### Table A–9. Example of a DRCE I<sup>2</sup>C Instruction With DRCE On

| BYTE<br>NUMBER | INSTRUCTION<br>(HEX) | INSTRUCTION DEFINITION                                    | TABLE                         |

#### A.7.1 DRCE On/Off

The DRCE default mode in the TAS3004 device is off.

The DRCE turns on if all eight bytes in Table A–9 are transmitted and the LSB of the above threshold ratio byte is 0.

The DRCE turns off if all eight bytes in Table A–10 are transmitted and the LSB of the above threshold ratio byte is 1. Table A–10 is identical to Table A–9 except for this third byte.

Table A–10. Example of a DRCE I<sup>2</sup>C Instruction With DRCE Off

| 8              | A0                   | Decay time constant 106 ms                                |                               |

### A.7.2 Above Threshold Ratios

The above threshold ratios are applied when the energy level of the incoming signal is detected anywhere between the threshold (from Table A-15) and 0 dB. See Figure A-1.

| HEXADECIMAL VALUE | RATIO (IN:OUT) |
|-------------------|----------------|
| 02                | 1.00 : 1       |
| 08                | 1.07 : 1       |
| 10                | 1.14 : 1       |
| 18                | 1.23 : 1       |
| 20                | 1.33 : 1       |
| 28                | 1.45 : 1       |
| 30                | 1.60 : 1       |
| 38                | 1.78 : 1       |
| 40                | 2.00 : 1       |
| 48                | 2.29 : 1       |
| 50                | 2.67 : 1       |
| 58                | 3.20 : 1       |
| 60                | 4.00 : 1       |
| 68                | 5.33 : 1       |
| 70                | 8.00 : 1       |
| 78                | 16.0 : 1       |

Table A–11. Above Threshold Ratios for Compression

| HEXADECIMAL VALUE | RATIO (IN:OUT) |
|-------------------|----------------|
| 02                | 1 : 1.00       |
| 0A                | 1 : 1.06       |
| 12                | 1 : 1.13       |
| 1A                | 1 : 1.19       |
| 22                | 1 : 1.25       |
| 2A                | 1 : 1.31       |
| 32                | 1 : 1.38       |
| 3A                | 1 : 1.44       |
| 42                | 1 : 1.50       |

Table A–12. Above Threshold Ratios for Expansion

#### A.7.3 Below Threshold Ratios

The below threshold ratios are applied when the energy level of the incoming signal is detected as being anywhere between the threshold (from Table A-15) and -89.625 dB. See Figure A-1.

| HEXADECIMAL VALUE | RATIO (IN:OUT) |
|-------------------|----------------|
| 02                | 1 : 1.00       |
| 08                | 1 : 1.06       |
| 10                | 1 : 1.13       |
| 18                | 1 : 1.19       |
| 20                | 1 : 1.25       |
| 28                | 1 : 1.31       |
| 30                | 1 : 1.38       |
| 38                | 1 : 1.44       |
| 40                | 1 : 1.50       |
| 48                | 1 : 1.56       |
| 50                | 1 : 1.63       |
| 58                | 1 : 1.69       |
| 60                | 1 : 1.75       |
| 68                | 1 : 1.81       |
| 70                | 1 : 1.88       |
| 78                | 1 : 1.94       |
| 80                | 1 : 2.00       |

|                |

### A.7.4 Threshold

Table A–15 lists a range of threshold values from 0 dB to –89.625 dB in 0.75-dB decrements.

**NOTE:** The TAS3004 device is capable of 0.375-dB increments. The associated hexidecimal value can be determined by interpolating between the existing hexidecimal values in Table A–15.

| HEX<br>VALUE | dB      |
|--------------|--------|--------------|--------|--------------|--------|--------------|--------|--------------|---------|
| EF           | 0      | BD           | -18.75 | 8B           | -37.50 | 59           | -56.25 | 27           | -75.00  |
| ED           | -0.75  | BB           | -19.50 | 89           | -38.25 | 57           | -57.00 | 25           | -75.75  |
| EB           | -1.50  | B9           | -20.25 | 87           | -39.00 | 55           | -57.75 | 23           | -76.50  |
| E9           | -2.25  | B7           | -21.00 | 85           | -39.75 | 53           | -58.50 | 21           | -77.25  |

Table A–15. Threshold Values

#### A.7.5 Time Constants

Use Table A–16 to program the attack time, the decay time, and the integration interval for energy level detection.

Level detection is performed by using an alpha filter at the input of the DRCE, which functions as an energy-level detection block for the DRCE. The time constant for level detection can be thought of as an integration interval. Use a time constant from Table A–16 as an integration interval for energy level detection.

Table A–16 lists the time constants used for integration interval for energy level detection, attack time constant, and decay time constant. All values represent the time required to reach 63% of maximum value from zero.

| HEXADECIMAL VALUE | TIME DELAY |
|-------------------|------------|
| 40                | 1.7 ms     |
| 50                | 3.5 ms     |
| 60                | 6.7 ms     |
| 70                | 13 ms      |
| 80                | 26 ms      |
| 90                | 53 ms      |
| A0                | 106 ms     |
| BO                | 212 ms     |
| CO                | 425 ms     |
| D0                | 850 ms     |
| EO                | 1.7 s      |
| F0                | 2.4 s      |

Table A–16. Time Constants

#### A.7.6 DRCE Example With Threshold at –12 dB

From the DRCE example shown in Figure A–2, the threshold is set at -12 dB. The input energy E, has a value of -6 dB.

Output  $(dB) = [T(dB) + (E(dB) - T(dB)) \times (1/CR)]$ 

$$= [-12 + (-6 - (-12)) \times (1/3)] dE$$
$$= -12 + 2 = -10 dB$$

Where:

CR = Compression Ratio

T = Threshold (dB)

E = Energy estimate of current input

Note: Energy of sine wave is approximately 3 dB lower than peak.

Figure A-2. DRCE Example With Threshold at -12 dB

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- C. Falls within JEDEC MS-026

PFB (S-PQFP-G48)

NOTES: A. All linear dimensions are in millimeters.

- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
- E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
