

TRUE DIGITAL AUDIO AMPLIFIER TAS5015 DIGITAL AUDIO PWM PROCESSOR

FEATURES

- **TAS5015 Plus Discrete Back-End TDAA System — High-Quality Digital Audio Amplification**
- **112-dB Dynamic Range (TAS5015 Device)**
- **THD+N < 0.01%**
- **Power Efficiency Is 90% into 8-Ω Load**
- **16-, 20-, or 24-Bit Input Data**
- **44.1-kHz, 48-kHz, 88.2-kHz, 96-kHz, 176.4-kHz, 192-kHz Sampling Rates**
- **Economical 48-Pin TQFP Package**
- **External PLL**
- **3.3-V Power Supply**
- **Mute**
- **Clicks and Pops Reduction (Patent Pending)**

APPLICATIONS

- **High-Performance Digital Amplification For:**
 - **Integrated Amplifiers**
 - **AV Receiver**
 - **Car Audio**

DESCRIPTION

The true digital audio amplifier (TDAA) is a new paradigm in digital audio. One TDAA system consists of the TAS5015 PCM-PWM modulator device plus a discrete back-end TDAA power output. This system accepts a serial PCM digital audio stream and converts it to a 3.3-V PWM audio stream (TAS5015). The discrete back-end TDAA then provides a large-signal PWM output. This digital PWM signal is then demodulated, providing power output for driving loudspeakers. This patented technology provides low-cost, high-quality, high-efficiency digital audio applicable to many audio systems developed for the digital age. The TAS5015 is an innovative, cost-effective, high-performance 24-bit stereo PCM-PWM modulator based on Equibit™ technology. The TAS5015 has a wide variety of serial input options including right-justified (16, 20, or 24 bits), IIS (16, 20, or 24 bits), left-justified (16 bits), or DSP (16 bits) data formats. It is fully compatible with AES standard sampling rates (Fs) of 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 176.4 kHz, and 192 kHz. The TAS5015 also provides a de-emphasis function for 44.1-kHz and 48-kHz sampling rates.

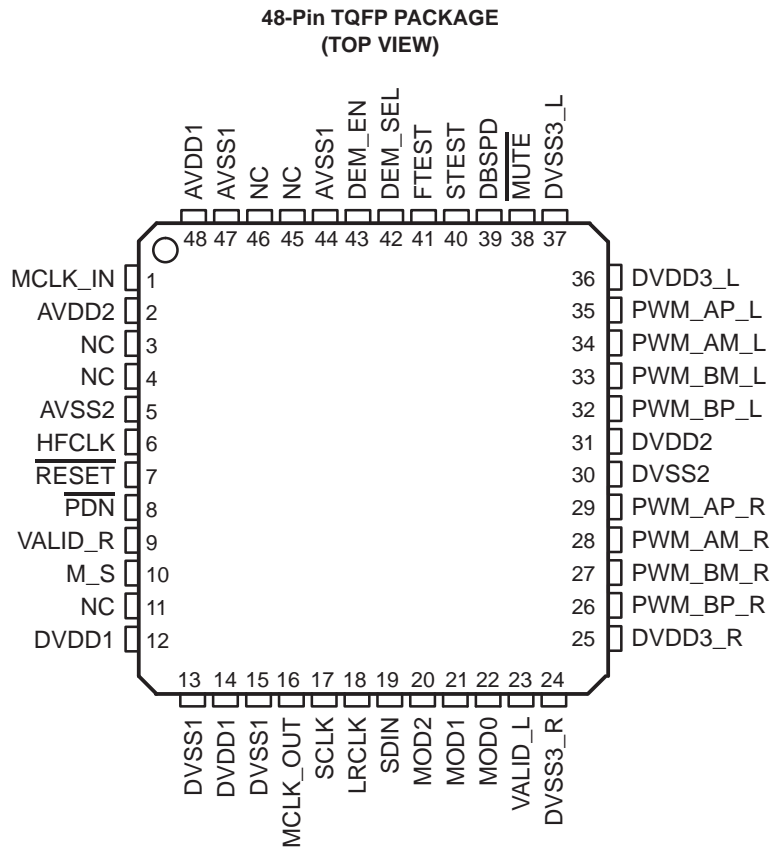

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Equibit is a trademark of Toccata Technology ApS, Denmark.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

PWM_AP_R	29	O	PWM right output A (differential +)
PWM_BM_L	33	O	PWM left output B (differential -)
PWM_BM_R	27	O	PWM right output B (differential -)
PWM_BP_L	32	O	PWM left output B (differential +)
PWM_BP_R	26	O	PWM right output B (differential +)
RESET	7	I	Reset (active low)
SCLK	17	I/O	Shift clock (input when M_S = 0, output when M_S = 1)
SDIN	19	I	Stereo serial audio data input
STEST	40	I	Tied to DVSS1 for normal operation
VALID_L	23	O	PWM left outputs valid (active high)
VALID_R	9	O	PWM right outputs valid (active high)

functional description

serial audio port

The serial audio port consists of a shift clock (SCLK pin), a left/right frame synchronization clock (LRCLK pin), and a data input (SDIN pin). The serial audio port supports standard serial PCM formats ($F_s = 44.1\text{-kHz}$, 48-kHz , 88.2-kHz , 96-kHz , 176.4-kHz , or 192-kHz stereo). See the *serial interface formats* section.

system clocks—master mode and slave mode

The TAS5015 allows multiple system clocking schemes. Master mode indicates that the TAS5015 provides system clocks to other parts of the system ($M_S=1$). Audio system clocks of frequency $128 F_s$ MCLK_OUT (quad speed), $64 F_s$ SCLK, and F_s LRCLK are output from this device when it is configured in master mode. Slave mode indicates that a system master other than the TAS5015 provides system clocks (LRCLK, SCLK, and MCLK_IN) to the TAS5015 ($M_S = 0$). The TAS5015 operates with LRCLK and SCLK synchronized to MCLK. The TAS5015 does not require any specific phase relationship between LRCLK and MCLK, but there must be synchronization. In the slave mode, MCLK_OUT is driven low. Table 1 shows all the possible master and slave modes.

sampling frequency

The normal sampling frequency is either 11.2896 MHz ($F_s = 44.1\text{ kHz}$) or 12.288 MHz ($F_s = 48\text{ kHz}$). Twice the normal sampling frequency can be selected by using the DBSPD pin which allows usage of $F_s = 88.2\text{ kHz}$ or $F_s = 96\text{ kHz}$. In the double-speed slave mode ($DBSPD = 1$, $M_S = 0$), the external clock input is either 22.5796 MHz ($F_s = 88.2\text{ kHz}$) or 24.576 MHz ($F_s = 96\text{ kHz}$). Table 1 explains the proper clock selection.

Table 1. External Clock and External PLL Functions

DESCRIPTION	M_S	DBSPD	DEM_EN	DEM_SEL	MCLK_IN (MHz)	HFCLK (MHz)	SCLK (MHz)	LRCLK (KHz)	MCLK_OUT (MHz)

			0	0					

- NOTES:
1. SCLK and LRCLK are outputs
 2. MCLK_IN tied LOW
 3. External MCLK connected to MCLK_IN input
 4. SCLK and LRCLK are inputs
 5. MCLK_OUT is a buffered version of the external MCLK input

functional description (continued)

Table 1. External Clock and External PLL Functions (Continued)

DESCRIPTION	M_S	DBSPD	DEM_EN	DEM_SEL	MCLK_IN (MHz)	HFCLK (MHz)	SCLK (MHz)	LRCLK (kHz)	MCLK_OUT (MHz)
External PLL, slave, double speed (see Notes 3, 4, and 5)	0	1	0	0	22.5792	90.3168	5.6448	88.2	22.5792
External PLL, slave, double speed (see Notes 3, 4, and 5)	0	1	0	0	24.576	98.304	6.144	96	24.576
External PLL, slave, quad speed (see Notes 3, 4, and 5)	0	0	0	0	22.5792	90.3168	11.2896	176.4	22.5792
External PLL, slave, quad speed (see Notes 3, 4, and 5)	0	0	0	0	24.576	98.304	12.288	192	24.576

NOTES: 3. External MCLK connected to MCLK_IN input
 4. SCLK and LRCLK are inputs
 5. MCLK_OUT is a buffered version of the external MCLK input

external PLL

For the highest system performance, an external PLL must be used with the TAS5015. For normal-speed mode, the external PLL input (HFCLK) must be 2048 Fs, for double-speed mode HFCLK must be 1024 Fs, and for quad-speed mode HFCLK must be 512 Fs.

digital interpolation filter

The 24-bit high-performance linear phase FIR interpolation filter up-samples the input digital data at a rate of two times (quad-speed mode = 176.4 kHz or 192 kHz), four times (double-speed mode = 88.2 kHz or 96 kHz), or eight times (normal mode = 44.1 kHz or 48 kHz) the incoming sample rate. This filter provides low pass-band ripple and optimized time domain transient response for accurate music reproduction.

digital PWM modulator

The interpolation filter output is sent to the digital PWM modulator. This modulator consists of a high-performance fourth order digital-noise shaper and a PCM-to-PWM converter. Following the noise shaper, the PCM signal is fed into a low distortion PCM-to-PWM conversion block, buffered, and output from the chip. The modulation scheme is based on a 2-state control of the H-bridge output.

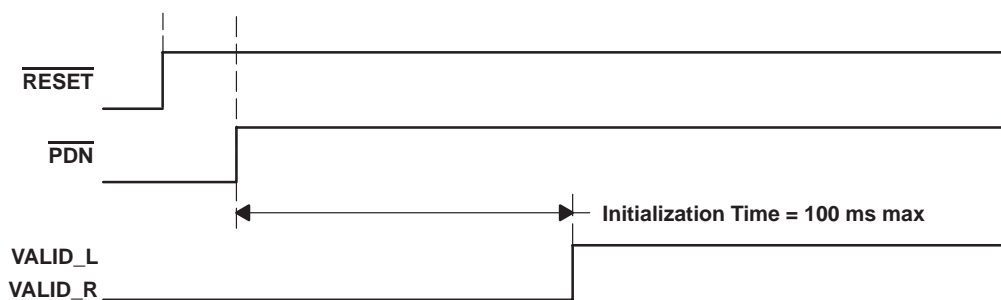

control, status, and operational modes

The TAS5015 control section consists of several control-input pins. Three serial mode pins (MOD0, MOD1, and MOD2) are provided to select various serial data formats. During normal operating conditions if any of the MOD0, MOD1, or MOD2 pins changes state, a reset sequence is initiated. Also provided are separate power-down ($\overline{\text{PDN}}$), reset ($\overline{\text{RESET}}$), and mute ($\overline{\text{MUTE}}$) pins.

power up

At power up, the VALID_L and VALID_R pins are asserted low and the PWM outputs go to the hard mute state in which the P outputs are held low and the M outputs are held high. Following initialization, the TAS5015 comes up in the operational state (differential PWM audio). There are two cases of power-up timing. The first case is shown in Figure 1 with $\overline{\text{RESET}}$ preceding $\overline{\text{PDN}}$. The second case is shown in Figure 2 with $\overline{\text{PDN}}$ preceding $\overline{\text{RESET}}$.

functional description (continued)

Figure 1. Power-Up Timing ($\overline{\text{RESET}}$ Preceding $\overline{\text{PDN}}$)Figure 2. Power-Up Timing ($\overline{\text{PDN}}$ Preceding $\overline{\text{RESET}}$)

reset

The reset signal for the TAS5015 must be applied whenever toggling the M_S, DBSPD signal. This reset is asynchronous. See Figure 3 for reset timing. To initiate the reset sequence the $\overline{\text{RESET}}$ pin is asserted low. As long as the pin is held low the chip is in the reset state. During this reset time, the PWM outputs are hard-muted (P-outputs held low and M-outputs held high) and the PWM outputs valid pins (VALID_L, VALID_R) are held low. Assuming $\overline{\text{PDN}}$ is high, the rising edge of the reset pulse begins chip initialization. After the initialization time, the TAS5015 begins normal operation.

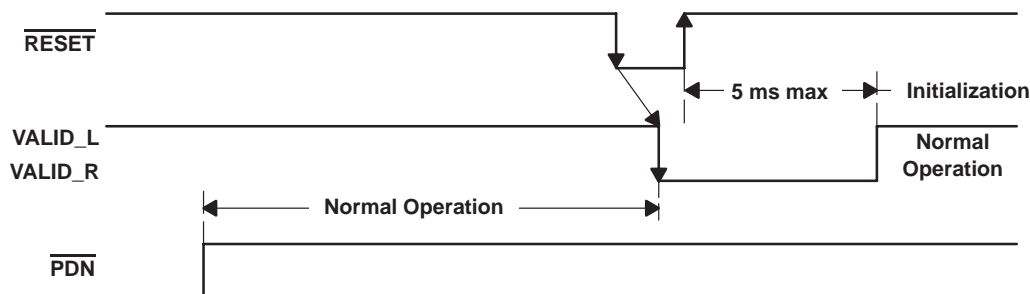

Figure 3. Reset Timing

power down

Note that power down is an asynchronous operation. To place the device in total power-down mode, both $\overline{\text{RESET}}$ and $\overline{\text{PDN}}$ must be held low. As long as these pins are held low, the chip is in the power-down state and the PWM outputs are hard muted with the P outputs held low and the M outputs held high. To place the device back into normal mode, see the *power up* section.

NOTE:

In order for the dynamic logic to be properly powered down, the clocks should not be stopped before the $\overline{\text{PDN}}$ pin goes low. Otherwise, the device may drain additional supply current.

functional description (continued)

Figure 4. Power-Down Timing

mute

The TAS5015 provides a mute function that is used when the $\overline{\text{MUTE}}$ pin is asserted low. See Table 2 for mute description. This mute is a quiet mute; that is, the mute is accomplished by outputting a zero value waveform in which both sides of the differential PWM outputs have a 50% duty cycle (see Figure 5 for mute timing).

Table 2. Mute Description

$\overline{\text{MUTE}}$	P OUTPUTS	M OUTPUTS	DESCRIPTION
0	50% duty cycle	50% duty cycle	Mute
1	DATA	$\overline{\text{DATA}}$	Normal operation

Figure 5. Mute Timing

double speed

Double-speed mode is used to support sampling rates of 88.2 kHz and 96 kHz. In order to put the TAS5015 in double-speed mode with the device in normal operating conditions, the $\overline{\text{RESET}}$ pin must be held low while switching the DBSPD pin high. After the $\overline{\text{RESET}}$ pin is brought high again, a reset sequence takes place. If the change is at power up, a power-up sequence is originated.

quad speed

Quad-speed mode is used to support sampling rates of 176.4 kHz and 192 kHz. In order to put the TAS5015 in quad-speed slave mode, M_S and DBPSB pins are brought low. Quad-speed mode is then automatically detected due to the fact that it is the only mode in which MCLK_IN is 128 Fs. DEM_SEL must be set to low when operating in the quad-speed slave mode. For quad-speed master mode M_S = 1, DBSPD = 0, DEM_SEL = 1, and DEM_EN = 0.

functional description (continued)

de-emphasis filter

For audio sources that have been preemphasized, a precision 50 μ s/15 μ s de-emphasis filter is provided to support the sampling rates of 44.1 kHz and 48 kHz. Pins DEM_SEL and DEM_EN select the de-emphasis functions. See Figure 6 for a graph showing the de-emphasis filtering characteristics. See Table 3 for de-emphasis selection.

Figure 6. De-Emphasis Filter Characteristics

de-emphasis selection

De-emphasis selection is accomplished by using the DEM_SEL and DEM_EN pins. See Table 3 for de-emphasis selection description.

Table 3. De-Emphasis Selection

DEM_SEL	DEM_EN	DESCRIPTION
0	0	De-emphasis disabled
0	1	De-emphasis enabled for $F_s = 44.1$ kHz
1	1	De-emphasis enabled for $F_s = 48$ kHz
1	0	Disallowed state. Do not use.

error status reporting (VALID_L and VALID_R)

The following is a list of the error conditions that will cause the VALID_L and VALID_R pins to be asserted low.

- No clocks
- Clock phase errors

When either of the above conditions is met, the VALID_L and VALID_R goes low and the PWM outputs go to the hard mute state. If the error condition is removed, the TAS5015 is reinitialized and the VALID_L and VALID_R pins are asserted high.

serial interface formats

The TAS5015 is compatible with eight different serial interfaces. Available interface options are IIS, right justified, left justified, and DSP frame. Table 4 indicates how these options are selected using the MOD0, MOD1, and MOD2 pins.

functional description (continued)

Table 4. Hardware Selection of Serial Audio Modes

MODE	MOD2 PIN	MOD1 PIN	MOD0 PIN	SERIAL INTERFACE SDIN
0	0	0	0	16-bit, MSB first; right justified
1	0	0	1	20-bit, MSB first; right justified
2	0	1	0	24-bit, MSB first; right justified
3	0	1	1	16-bit IIS
4	1	0	0	20-bit IIS
5	1	0	1	24-bit IIS
6	1	1	0	16-bit MSB first, left justified
7	1	1	1	16-bit DSP frame

The following figures illustrate the relationship between the SCLK, LRCLK, and the serial data I/O for the different interface protocols. Note that there are always 64 SCLKs per LRCLK. The nondata bits are padded with binary 0s.

MSB first, right-justified (for 16, 20, 24 bits)

Figure 7. MSB First Right Justified

Note the following characteristics of this protocol.

- Left channel is received when LRCLK is high.
- Right channel is received when LRCLK is low.
- SDIN is sampled at the rising edge of SCLK.

functional description (continued)

IIS compatible serial format (for 16, 20, 24 bits)

- SDIN is sampled at the rising edge of SCLK.

functional description (continued)

DSP compatible serial interface format (for 16 bits)

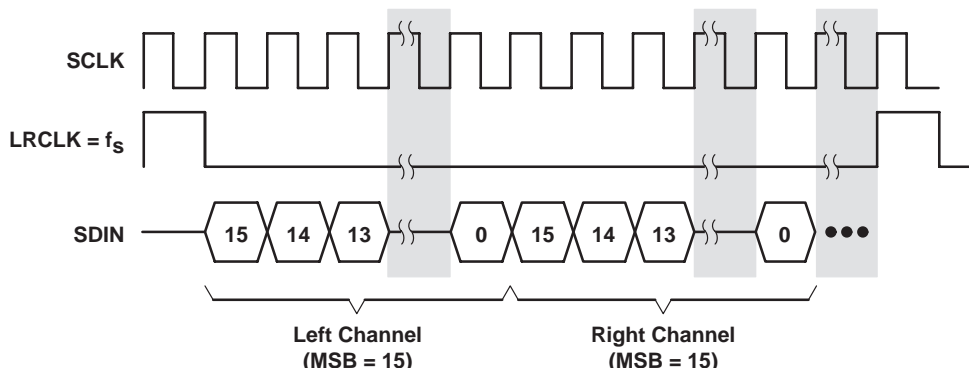

Figure 10. DSP Compatible Serial Interface Format

Note the following characteristic of this protocol.

- Serial data is sampled with the falling edge of SCLK.

PWM Outputs

The TAS5015 is designed to be used with a discrete back-end. The TAS5015 PWM outputs provide differential 3.3-V square-wave signals. During normal operation these outputs represent the input PCM audio in the pulse-width modulation scheme. In the hard-mute state the P outputs (PWM_AP_L, PWM_BP_L, PWM_AP_R, and PWM_BP_R) are held low and the M outputs (PWM_AM_L, PWM_BM_L, PWM_AM_R, and PWM_BM_R) are held high. In the quiet-mute state the differential PWM outputs have a 50% duty cycle.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
TAS5015PFB	NRND	TQFP	PFB	48	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
TAS5015PFBG4	NRND	TQFP	PFB	48	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
