#### NOTES

1. A socket with a center opening to clear the tubulation should be used. Care should be taken in handling the tube to avoid damaging the exposed tubulation and bending the base pins.
  2. Brilliance and definition decrease with decreasing accelerator voltage. In general, accelerator voltage should not be less than 7,000 volts.
  3. With Grid No. 1 voltage adjusted to produce an accelerator current of 100  $\mu$ A.
  4. Visual extinction of undeflected, focused spot.
  5. Measured in accordance with ML-E-1 specifications at an accelerator current of 100  $\mu$ A.
  6. The center of the undeflected, focused spot will fall within a circle of  $\frac{3}{8}$ -inch radius concentric with the center of the tube face, with the tube shielded.
- The P16, P19 and P25 screens can be permanently damaged if current density is permitted to rise too high. To prevent burning, minimum beam current densities should be employed.
